ENVIRONMENTAL ASSESSMENT BOARD
ONTARIO HYDRO DEMAND/SUPPLY PLAN HEARING

IN THE MATTER OF the Environmental Assessment Act,
R.S.O. 1980, c. 140, as amended, and Regulations
thereunder;

AND IN THE MATTER OF an undertaking by Ontario Hydro
consisting of a program in respect of activities
associated with meeting future electricity
requirements in Ontario.

Held on the 5th Floor, 2200
Yonge Street, Toronto, Ontario,
on Thursday, the 17th day of October,
1991, commencing at 9:15 a.m.

VOLUME 74

1 ---On commencing at 9:15 a.m.

2 THE REGISTRAR: Please come to order.
3 This hearing is now in session. Be seated, please.

4 MRS. FORMUSA: Good morning. Mr.
5 Campbell has asked me to be here this morning as he
6 will be a few moments late. He had a previous
7 appointment.

8 THE CHAIRMAN: Thank you.

9 Mr. Watson?

10 MR. WATSON: Thank you, Mr. Chairman.

11 KEITH DOUGLAS BROWN,
12 PAUL FRANK VYROSTKO,
JOHN KENNETH SNELSON; Resumed.

13 CROSS-EXAMINATION BY MR. WATSON (cont'd):

14 Q. Panel, I would like you to turn to
15 page 42 of Exhibit 340, please. I understand that the
16 pulp and paper industry is the largest source of
17 potential cogeneration sites in Ontario; is that
18 correct?

19 MR. BROWN: A. Based on the Leighton and
20 Kidd data, yes, that's correct.

21 Q. And that's the data that you rely on?

22 A. Yes. In terms of technical and
23 attainable potential, yes.

24 Q. And in fact this interrogatory
25 indicates that roughly half of the potential is in pulp

1 and paper.

2 A. Half of our 1,200 forecast comes from
3 pulp and paper, yes.

4 Q. Mr. Brown, I was listening to the
5 radio this morning and I heard that the pulp and paper
6 industry is suffering some difficulties, is that your
7 understanding as well?

8 A. They enjoyed some good times over the
9 past and now they are in a tough period, that's
10 correct.

11 Q. Is it fair to say that the difficult
12 times that the pulp and paper industry is facing now
13 may affect the development of cogeneration NUGs?

14 A. In the short term I think that's
15 correct. I think it is a little early to judge the
16 long-term potential.

17 Q. But it is a concern.

18 A. It is a concern right now.

19 Q. Have any pulp and paper mills
20 identified in your steam data base closed since the
21 time of the 1990 NUG plan?

22 A. I don't believe so.

23 Q. And, of course, if in fact you find
24 out that some have closed, that your information is not
25 up-to-date, you will let us know?

1 A. Every year when we produce the NUG
2 plan we go through our entire list, updating the
3 technical potential by removing sites that are retired
4 or out of business and adding those that increase their
5 potential.

6 Q. So we will see that in your 1991
7 plan?

8 A. If the information is available,
9 that's correct.

10 Q. Can you tell us how many sites that
11 are in your steam data base have a capacity factor
12 greater than 70 per cent and are in the pulp and paper
13 industry?

14 A. I think I could, I don't have that
15 information with me.

16 Q. Could you give us an undertaking to
17 that effect, please?

18 A. Actually, you would have it already
19 in front of you. This 645 would be the ones in the top
20 group.

21 Q. So, they are all 70 per cent or
22 better?

23 A. That's correct.

24 Q. Okay.

25 THE CHAIRMAN: So all the pulp and paper

1 in excess of 70 per cent, is that what you are saying?

2 MR. BROWN: No, all the ones that are on
3 Interrogatory 5.9.48, the 645 that's in our forecast,
4 all of those are 70 per cent or greater. There would
5 be others that are below 70 per cent.

6 THE CHAIRMAN: We better get 5.9.48 on
7 the record then. No.?

8 THE REGISTRAR: That has previously been
9 entered as 321.37.

10 THE CHAIRMAN: 321.37, thank you.

11 MR. WATSON: Q. Mr. Brown, do you know
12 how many sites are involved with that 645 megawatts?

13 MR. BROWN: A. I can get you that at the
14 break.

15 Q. Thank you. Mr. Brown, can you tell
16 us whether a site which may not have a 20 year future
17 would invest in cogeneration facilities?

18 A. I'm not aware of that. Our forecast
19 as a cogen is a long-term business and we are looking
20 at 30 year lives for cogeneration.

21 Q. So, if a site for any number of
22 reasons didn't look as though it had a 20 year future,
23 it's probably not a good site for cogen then?

24 A. Well, the rates of return are such
25 that they are going to get their money back in five

1 years, but people that are investing in this business
2 are making long-term decisions, and the experience to
3 date is these facilities have been in for many years
4 and not put in for five years and then taken it out.

5 Q. We talked about the problems in the
6 pulp and paper industry, is it fair to say that a lot
7 of them are due to the fact that the equipment is
8 outdated and the industry in Canada is just having a
9 tough time competing with that equipment?

10 A. I am not an expert in the industry,
11 but their position I believe right now is the fact they
12 don't have enough recycled paper and there is a lot of
13 demands to use recycled paper to sell your product, and
14 the Canadian market is a virgin wood market and that's
15 there expertise. So, they are having trouble competing
16 in this environment right now.

17 Q. And you need specialized equipment to
18 compete in that environment, would you not?

19 A. They would have to get de-inking
20 mills and other equipment to recycle the paper and mix
21 it with their virgin wood.

22 Q. Mr. Vyrostko, I believe you testified
23 at the OEB hearing with respect to companies
24 withdrawing from NUG programs because a company's
25 economic situation has changed. I believe you

1 indicated that you have had situations where that has
2 occurred; is that fair?

3 MR. VYROSTKO: A. That's correct.

4 Q. I assume it is possible in the future
5 that certain projects which currently have been
6 established to be economic could also be withdrawn due
7 to economics within the company which are unrelated to
8 the specific NUG project economics; is that fair?

9 A. I think we can continue to see
10 projects in the future that initially thought that they
11 could go forward not going forward because of changing
12 economic circumstances, yes.

13 Q. Has this possibility been accounted
14 for in the NUG forecast, Mr. Brown?

15 MR. BROWN: A. This affects the timing
16 of NUGs and when we look at our forecasts, we look at
17 the economics and some will be in and some will be out.

18 Our cut-off is the 70 per cent level that
19 was used in the 1990 plan. There is a possibility that
20 others below the 70 per cent steam capacity factor are
21 going through and others in the above not making it.

22 In terms of timing, over a 10 year period
23 it's hard to say whether a project because of financial
24 difficulties is -- the delay will impact on a NUG plan.

25 In the first years of the NUG plan we

1 used project data from proponents to tell us the
2 timing. In the long term I used the Leighton and Kidd
3 information because that's all we have. So, we try and
4 incorporate as much information as we can in terms of
5 timing from the proponents themselves. If they are
6 seeing a delay in a project and we are aware of it, we
7 incorporate that.

8 Q. No doubt the timing is a problem, Mr.
9 Brown, and certainly would be an outcome of this
10 scenario. Isn't it also fair to say that if in fact a
11 particular industry or a particular operation closed,
12 then you are into more than a timing effect?

13 A. Yes, and that would be -- I would be
14 changing my forecast if that information was around.

15 Q. Mr. Snelson, I believe in your direct
16 evidence you were talking about transmission
17 constraints between the east and the west portion of
18 the province. I understand from the 1990 NUG plan that
19 there is a limitation of 250 megawatts for the
20 northwest region which you expect to be filled by the
21 year 1993. Is that still accurate?

22 A. That is a statement that I have in
23 the NUG plan and that was based on information about a
24 year ago. Mr. Snelson might be able to update that.

25 MR. SNELSON: A. The information we have

1 given in answer to an interrogatory is that there is
2 room for approximately 100 megawatts more in the west
3 system, and that's Interrogatory 5.14.221.

4 [9:26 a.m.]

5 THE REGISTRAR: That will be 321.49.

6 ---EXHIBIT NO. 321.49: Interrogatory No. 5.14.221.

7 (Later deleted.)

8 MR. WATSON: Q. That's 100 megawatts in
9 the west system, Mr. Snelson.

10 I understand the NUG plan at page 10 was
11 talking about the amount of purchased non-utility
12 generation that can be transmitted from the northwest
13 region.

14 I assume that -- and they were talking
15 about a 250 megawatt limit at that time. Is it fair to
16 say that the fact that there is now a 100 megawatt
17 limit decreases the amount of purchased generation that
18 can be transmitted from that northwest region?

19 MR. SNELSON: A. I don't believe so.
20 The 100 megawatts is in addition to what is already
21 contracted, and the 250 megawatts would be against some
22 lower base.

23 Q. Okay. Just dealing with the
24 northwest region, my understanding is that in looking
25 at the steam sites with steam capacity factors greater

1 than 70 per cent, five out of the 19 sites are in the
2 northwest region.

3 Does that sound about right, Mr. Brown?

4 MR. BROWN: A. The information in
5 interrogatories is 286 megawatts of the 1,435 is
6 northwest region. I am not aware of the number of
7 sites at this time.

8 DR. CONNELL: Could I just clarify for
9 the record, I think we are using "west system" and
10 "northwest region" synonymously. Is it correct to use
11 them synonymously?

12 MR. SNELSON: Yes, it is correct to use
13 them synonymously.

14 THE CHAIRMAN: That's a little confusing
15 because in this list there is "central", "northwest",
16 "northeastern", "eastern", "western" and
17 "northwestern".

18 MR. SNELSON: Sorry. Maybe our
19 terminology is a little confusing.

20 We think of our system as being two
21 systems: the "west system", which is the northwest
22 region and is loosely connected to the rest of the
23 system, and the "east system".

24 We also have regions, and the northwest
25 region has the same general boundaries as the west

1 system.

2 THE CHAIRMAN: So the western --

3 MR. SNELSON: The western region is
4 southwestern Ontario, is--

5 THE CHAIRMAN: -- eastern system?

6 MR. SNELSON: --part of the east system.
7 Maybe we should try and restrict ourselves to northwest
8 region as being perhaps clearer.

9 THE CHAIRMAN: Well, it may not be so
10 politically conscious if you would use north and south,
11 I suppose. (laughter)

12 MR. SNELSON: Well, the north includes
13 northeast region as well as northwest region.

14 MR. WATSON: Q. Looking at the same
15 interrogatory, Mr. Brown, that's 5.9.48, as you have
16 indicated, that gives a breakdown of potential by
17 region.

18 Now, does this correspond exactly with
19 the sites in the steam data base over the 70 per cent
20 steam capacity factor?

21 MR. BROWN: A. No, it wouldn't. It's
22 the same number of sites, the same sites themselves.
23 It's just that if a project comes in above the
24 estimated technical potential, this would reflect that.

25 Q. Mr. Brown, talking about the

1 geographic location of some of these sites, just assume
2 for a second if all of the sites that are in Leighton
3 and Kidd with a 70 per cent steam capacity or more were
4 in one region, say the central region, would you still
5 show the same breakdown by region that you have in this
6 interrogatory?

7 A. If they're all in the central region
8 then -- this breakdown is from the 70 per cent group.

9 Q. Yes?

10 A. So if the 70 per cent group is all
11 central region, then it would be put in that category.

12 Q. Perhaps we will get to this in direct
13 evidence, Mr. Brown, but it was my understanding that
14 the 70-per-cent-plus sites in the northwest region
15 provide more megawatt capacity than is shown in your
16 interrogatories; is that not correct?

17 A. I will check into that. The
18 information in 5.9.48 is what we are planning on and is
19 our estimate of the attainable potential of the
20 northwest region. I can check into these 19 sites you
21 are referring to.

22 Another indication is on Table A1.3 in
23 the 1990 NUG plan, page 20 provides a regional
24 breakdown of the complete list and you will find
25 northwest region represents 800 megawatts of the 6,400

1 in the remaining Leighton and Kidd information.

2 But that is a complete list that's shown
3 on that table.

4 Q. What would happen with that
5 achievable potential, Mr. Brown, in the northwest
6 region if it could not be developed because of a
7 transmission constraint? Would that simply be removed
8 from your total of achievable potential?

9 A. In the 1990 NUG plan we estimated a
10 total potential in the province and then estimated how
11 much could be developed because of transmission in the
12 northwest region. The difference was then moved to the
13 rest of the system. It wasn't excluded.

14 Q. So you are saying there is a certain
15 potential in the northwest region; if you can't realize
16 it, it will be moved elsewhere?

17 A. Our assumption was that it would be
18 developed in some other part of the province.

19 Q. What is the basis for that
20 assumption?

21 A. The number that was calculated for
22 the year 2000 did not look at transmission
23 restrictions, so the 2,100 was just the number without
24 transmission.

25 When we started doing regional breakdowns

1 we did not lower the 2,100 because of that, and I think
2 to be fair you probably could have lowered it. I
3 believe there is about 40 megawatts if we did it that
4 way.

5 The 1991 NUG plan will not look at these
6 transmission restrictions because it doesn't clearly
7 identify where we are going to have problems, if I
8 assume that NUGs will only go where transmission is
9 available at the present time. This is a 25 year plan
10 and it doesn't incorporate future changes in
11 transmission.

12 Q. So if they aren't developed in the
13 northwest for transmission reasons they would show up
14 elsewhere.

15 Now, Mr. Brown, we were talking just a
16 minute ago about the pulp and paper industry, and I
17 think we agreed that if in fact an industry shut down
18 it would be removed from the achievable potential; is
19 that fair?

20 A. It would be removed from the
21 technical and achievable.

22 Q. Yes. Now, isn't eliminating a site
23 because it shuts down equivalent to saying it can't be
24 developed because of transmission constraints?

25 A. No, that's not the same. When you

1 are shutting it down you are removing any potential of
2 cogeneration because there is no steam host.

3 A transmission restriction may not be a
4 long-term restriction eliminating development.

5 [9:38 a.m.]

6 Furthermore, there is no reason why the
7 customer cannot produce a load displacement generator
8 even though there is maybe a transmission generator
9 because he is not selling anything to Ontario Hydro.

10 Q. Mr. Brown, you were mentioning load
11 displacement. I guess it's fair to say then that it's
12 only load displacement that could be put up in a
13 situation such as that, for instance, because it
14 probably wouldn't be cost-effective to put a
15 transmission line in?

16 A. If it's a transmission problem, yes,
17 that's correct, that is it is available now but as Mr.
18 Snelson mentioned in his direct evidence, there are
19 plans by Ontario Hydro now to alleviate some of these
20 restrictions and may free up some of those bottlenecks.

21 Q. Mr. Snelson, perhaps you could turn
22 to page 43 of Exhibit 34? That's a speech by Mr.
23 Eliesen on September 11th. That's Exhibit 296 in these
24 proceedings, page 4.

25 And if you look at the fifth paragraph

1 from the bottom, the paragraph that starts with the
2 words, "As already mentioned...", you can see the last
3 sentence in that paragraph talks about transmission
4 limitation of 500 megawatts of new generation in the
5 province west of the greater Toronto area.

6 Just to clear up any confusion we might
7 be having, is Mr. Eliesen talking about the west system
8 there?

9 MR. SNELSON: A. No, I don't believe so.

10 Q. Okay. Do you know what he's talking
11 about?

12 A. I believe that he is referring to the
13 limits on the additional generation in generally the
14 southwestern Ontario area, which I described in my
15 direct-evidence as being the limitation to the west of
16 Metropolitan Toronto area that goes roughly from the
17 Hamilton area up to Georgian Bay, so anything that was
18 west of that line which includes southwestern Ontario
19 but not northern Ontario.

20 Q. So, you're saying that includes the
21 south, sorry, that includes the western region--

22 A. Yes.

23 Q --which is basically southwest of
24 Toronto? And would it also include part of the central
25 region as well?

1 A. I don't recall the precise boundary
2 between central region and western region, so I would
3 have to check on that.

4 Q. How does this 500 megawatts in the
5 western region tie in with the 250 megawatts in the
6 northeastern region? Is there any interaction between
7 those two?

8 A. Sorry, which 250 megawatts in
9 northeastern region were you referring to?

10 Q. The 250 megawatts that was mentioned
11 in the '90 NUG plan that we were discussing earlier in
12 the northwestern region.

13 A. Oh, northwestern region. I'm sorry.
14 They are substantially independent. I
15 mean, everything in a transmission system is
16 interrelated to some degree, but these are quite
17 different parts of the system, so the inter-
18 relationship would be quite small.

19 Q. Now are any of the 1,000 megawatts
20 that we have been discussing expected to be committed
21 by the end of the year in the western region Mr.
22 Eliesen was referring to?

23 MR. BROWN: A. Of the southwestern
24 Ontario western region ...

25 Q. Western region in the southwest part

1 of the province.

2 A. Of the rate offers that have been
3 accepted by proponents for Ontario Hydro, zero
4 megawatts have come from western region.

5 Q. And how about the northwestern
6 region?

7 A. I'm sorry, it's zero for
8 northwestern; it's 7 megawatts for western.

9 Q. So that leaves three regions. Could
10 you just give us a breakdown of what's happening in the
11 other three regions?

12 A. Northeast region is 785 megawatts;
13 central region is 157 megawatts; eastern region is 526
14 megawatts, and that adds up to the 1475 that was in
15 Exhibit 321.

16 Q. In looking at these projects --

17 A. Sorry, I meant 331, not 321. The
18 1475 is in Exhibit 331B.

19 Q. 331? Mr. Brown, in looking at these
20 allocations in the five regions, are you close to or
21 exceeding transmission capacities in any of these
22 regions with these new projects?

23 Perhaps Mr. Snelson could help us on
24 that.

25 MR. SNELSON: A. I'm afraid I can't help

1 you with that.

2 Q. Back to you Mr. Brown.

3 MR. BROWN: A. My understanding is
4 obviously there's no change in the northwest region
5 because there's zero megawatts there. The eastern
6 system is fairly tight. There's some room in the right
7 locations. Central region, there's lots of room.
8 Western region, I believe, we had the limit in Mr.
9 Eliesen's speech of over 500 megawatts. We still have
10 that left. And the northeast region, depending on the
11 location, there's room there too.

12 Q. Okay, so the eastern region is tight.
13 Does that mean that...

14 THE CHAIRMAN: Excuse me. I understand
15 this is interesting and relevant, but isn't it better
16 answered in a later panel - transmission constraints?
17 I think it's transmission constraints and NUGs'
18 participation in them or, is a good line of
19 questioning, but the details of these kinds of things
20 probably would be more easily answered in Panel 7.

21 MR. WATSON: I'll pursue that there, Mr.
22 Chairman.

23 THE CHAIRMAN: I think it's of some
24 interest to know how the NUG program fits into
25 transmission constraints. I think that's quite

1 pertinent.

2 MRS. FORMUSA: I can confirm Dr. Macedo
3 on Panel 7 will definitely be able to deal with that.
4 [9:45 a.m.]

5 MR. WATSON: Q. Mr. Brown, looking at
6 the 1989 NUG plan, the expected growth in capacity was
7 1,431 megawatts; is that fair?

8 THE CHAIRMAN: Where is that derived
9 from?

10 MR. WATSON: That's from 1989 NUG plan,
11 Figure 1 which is on page 45 of Exhibit 340.

12 MR. BROWN: 1,431 is correct and was
13 developed by taking a difference of 1,635 megawatts of
14 additions minus our estimate of retirement at that time
15 of over 200 megawatts, the difference was 1,431.

16 THE CHAIRMAN: So what is the second
17 figure, 1,635?

18 MR. BROWN: 1,635 was our estimate of new
19 NUGs coming on and at that time we estimated
20 retirements of older numbers of 17 megawatts per year,
21 which by the year 2000 would be 204 megawatts.

22 THE CHAIRMAN: So what again is 1,431
23 figure?

24 MR. BROWN: That is the difference
25 between the total number of additions minus the ones we

1 lose along the way. It's the net growth.

2 THE CHAIRMAN: Can this be keyed into
3 Exhibit 331?

4 MR. BROWN: No, because this is 1989 NUG
5 plan and the retirements have been changed.

6 THE CHAIRMAN: I see.

7 MR. WATSON: We will be getting into
8 that, Mr. Chairman.

9 Q. So we are looking at the 1989 NUG
10 plan here, Mr. Brown. I understand also that in 1989
11 the Ministry set a NUG target, Ministry of Energy set a
12 NUG target of 2,000 megawatts by the year 2000; is that
13 fair?

14 MR. BROWN: A. I believe in 1995 they
15 said they wanted 1,000 megawatts and it should moving
16 to 2,000 by the year 2000.

17 Q. And in fact we can see that reflected
18 in the Ministry of Energy news release which is at
19 pages 46 and 47 of Exhibit 340, in particular the
20 second paragraph of page 47, which the Ministry has
21 asked Hydro to double its target and that would be to
22 2,000 megawatts by the end of the century.

23 A. That's correct.

24 Q. If we are looking at 1990, switching
25 from 1989 to 1990 now. If we are looking at the 1990

1 NUG plan, the forecast for NUG growth was 2,083
2 megawatts; is that fair?

3 A. That's correct.

4 THE CHAIRMAN: Where is that coming from?

5 Sorry.

6 MR. BROWN: That is from the 1990 NUG
7 plan, page 31.

8 MR. WATSON: Which is reproduced at page
9 48 of Exhibit 340.

10 THE CHAIRMAN: Hasn't that figure been
11 revised? I am looking at 331, which I looked at for
12 all these figures.

13 MR. WATSON: I am going to get to that,
14 Mr. Chairman.

15 THE CHAIRMAN: This says 1990 forecast.
16 Is there a difference between the 1990 NUG plan and the
17 1990 forecast?

18 MR. BROWN: In the NUG plan we provide
19 two numbers, one is the total number of new NUGs coming
20 on line, that is 2,107, and that's in what is in
21 Exhibit 331.

22 Within the plan itself we estimate how
23 many NUGs they are going to retire over the life of the
24 plan, that is not in Exhibit 331, but it is in the plan
25 itself and will be in all future plans.

1 THE CHAIRMAN: All right.

2 MR. WATSON: Q. Just so that both of us
3 are clear, Mr. Brown, what we have been talking about
4 is the growth figure, and as you pointed out, that's
5 the difference between the new NUGs that are put on the
6 retirements that come off the system?

7 MR. BROWN: A. That's correct.

8 Q. So we looked at the '89 NUG plan
9 which showed a figure of 1,431, we saw the Ministry
10 target for 2,000, for the year 2000 was 2,000 megawatts
11 in '89, and then we switched to 1990 and at page 48 of
12 Exhibit 340 we saw that the NUG forecast was raised to
13 2,083 for NUG growth; is that fair?

14 A. That's correct.

15 Q. And it didn't escape my attention
16 that 2,083 figure was very close to the target set by
17 the Ministry.

18 A. It was close to 2,107 because we
19 changed retirements. Our forecast did not incorporate
20 the 2,000 target.

21 Q. Mr. Brown, the government filed an
22 exhibit, that was Exhibit 249, dealing with the
23 potential for energy conservation and CO(2) reduction
24 in Ontario and I have reproduced page 36 of that
25 exhibit on page 49 of Exhibit 340. If I could refer

1 you to the first paragraph on that page, they are
2 talking about the reduction of electricity growth, and
3 then in the second sentence they say, to supply this we
4 project that non-utility generation would be increased
5 to 3,300 megawatts, a 50 per cent increase from Hydro's
6 current target of 2,100 megawatts.

7 My understanding is that report was
8 filed in June of 1991. You would agree with me that
9 shortly thereafter in September of 1991 your chairman,
10 Mr. Eliesen announced an increase in the NUG target to
11 3,100 megawatts which is almost a 47 per cent increase.

12 A. He did announce 3,100, that's
13 correct.

14 Q. Mr. Brown, perhaps you could help me
15 out. We seem to have a pattern developing here.

16 A. Let me remove one myth. This is the
17 first time I have seen page 36 and I am the one that
18 started the calculation of 3,100, so obviously they are
19 unrelated.

20 Going back to the '89 plan, there is no
21 relation between what the government is forecasting and
22 what Ontario Hydro is forecasting. They have targets,
23 we have a forecast. And they are quite acceptable to
24 be doing that. There is no correlation at all between
25 the two numbers.

1 Q. It just happens that they seem to
2 agree all the way along.

3 A. Maybe we are both using the same
4 sources of information to do our planning.

5 Q. Well, you said yours was a forecast,
6 now the government has referred to it as a target and
7 you just indicated that of the government was referring
8 to it as a target. Now, if you look at the next page,
9 that's page 50 of Exhibit 340, your chairman seems to
10 have the same opinion as the government. You will see
11 that he is referring to it as a target throughout his
12 speech. If you look at, for instance, the fifth
13 paragraph from the bottom, the one that starts, "First
14 the good news," you will see that he refers to it as a
15 target there. The next paragraph, the third line, he
16 refers to it as a target when he was talking about the
17 earlier NUG plan. He then talks about a projection, in
18 fairness, in the next paragraph, and then in the second
19 last paragraph, the second line, he also refers to it
20 as a target.

21 It seems certainly fair to say that both
22 the Ministry and Hydro are referring to these figures
23 that they are putting forward as targets.

24 A. In the past we have always used the
25 word "forecast" for the NUG plan, and since the 1991

1 NUG plan has not been issued, the term "target" seemed
2 to be appropriate at that time until the NUG plan was
3 out, and when the 1991 NUG plan comes out we can now go
4 back to a forecast.

5 The official forecast is still the 1990
6 NUG plan, 2,107. Until the 1991 NUG plan comes out, we
7 don't have our new forecast yet.

8 Q. But in the fourth last paragraph Mr.
9 Eliesen isn't talking about the 3,100, he is talking
10 what has happened in the past, isn't he?

11 A. There is some confusion in this
12 speech, that's correct.

13 We have tried in the past to always use
14 the word "forecast", but because there are other parts
15 of the corporation that have targets, the terms are
16 used very loosely.

17 Q. Well, in fact, Mr. Vyrostko, didn't
18 you tell us earlier that the compensation of senior
19 people in the NUG department is tied to your
20 performance?

21 MR. VYROSTKO: A. I said that
22 performance of our senior staff is in fact determined
23 by how well they achieve certain expectations.

24 Q. It seems to me that we could look at
25 3,100, in effect, as a sales target?

1 A. If that was the target, you might
2 look at it like that. But I think we have stated a
3 number of times here and elsewhere that the goal of our
4 division is to go after maximum economic. There is no
5 ceiling to that.

6 Q. Well, if your compensation is tied to
7 performance, is it tied to a 3,100 figure?

8 A. First of all, in terms of
9 compensation, there are probably about 14 or 15
10 different elements that each of the individuals would
11 be monitored on. At most one would have to do with
12 specific megawatts. So, I wouldn't think that the
13 majority of a performance success in a given year is
14 the 1 megawatt number.

15 Q. And the one that is tied to
16 megawatts, is that tied to the 3,100?

17 A. No, it is just tied to the ability of
18 us to achieve the forecast.

19 Q. Panel, I would like to you refer to
20 Interrogatory 5.9.17, I believe I have provided the
21 clerk with that.

22 Do you have that, Mr. Lucas.

23 ---Off the record.

24 THE REGISTRAR: That will be 321.50.

25 THE CHAIRMAN: Thank you.

1 ---EXHIBIT NO. 321.50: Interrogatory No. 5.9.17.

2 MR. WATSON: Q. Panel, that
3 interrogatory talks about the competitive bidding
4 process and it indicates that you have assumed that the
5 open solicitation process as opposed to competitive
6 bidding will continue. And, Mr. Vyrostkco, as I
7 understand your earlier evidence, that was to the same
8 effect; is that correct?

9 MR. VYROSTKO: A. That's correct.

10 Q. Now, I was looking at a couple of
11 things. If you could turn to page 64 of Exhibit 340,
12 that's page 6 of Exhibit 319, your supplementary
13 witness statement, the top paragraph says that policies
14 on competitive bidding, among other things, are
15 currently under development. Also, I believe that Mr.
16 Eliesen in his speech referred to the fact that Hydro
17 was planning on moving toward an competitive bidding
18 process.

19 Can you help us with whether there is a
20 contradiction there?

21 A. No. I think there is no
22 contradiction. We are looking at moving towards
23 competitive bidding at some point in time in the
24 future.

25 We don't know when that will be. It will

1 depend on what the requirements are with respect to our
2 system needs and it will depend on how well we can in
3 fact negotiate the preferred NUGs that we are looking
4 at now.

5 But in order to be able to make any move
6 towards competitive bidding in the future, we have to
7 do some work at the front end to understand the
8 direction we want to take to start looking at some of
9 the advantages or disadvantages of the bidding process.
10 So, we are looking at sort of some of the successes in
11 the United States and some of the processes they are
12 following there to prepare ourselves for that
13 eventuality.

14 Q. Will any of this be dealt with at the
15 meeting on Friday, the meeting tomorrow?

16 A. I don't think so.

17 Q. Now, you mentioned you have to look
18 at the front end, that's so you can get an
19 understanding of where you are going, what direction
20 and you are going to look at other experience.

21 [10:03 a.m.]

22 Isn't it fair to say that competitive
23 bidding is going to give you a more focused direction
24 than the past process of open solicitation which is
25 anticipated to continue?

1 A. Typically what competitive bidding
2 does is it allows for an organized approach to
3 acquiring additional megawatts.

4 What it does, it allows a utility to
5 identify the number of megawatts that they would want,
6 timing for those megawatts, and then go after them in
7 an organized way.

8 Our open solicitation process in essence
9 did the same thing. The only difference was there was
10 no capacity limit, so both competitive bidding and open
11 solicitation is a way of proactively seeking out
12 projects.

13 Q. Well, there is no doubt that they are
14 both a way of seeking out projects, but isn't it fair
15 to say that competitive bidding can better match
16 resources with loads by requesting specific amounts and
17 locations of resources?

18 A. It can do that. Open solicitation
19 can as well if in our open solicitation we were to
20 specify exactly where we wanted the projects.

21 The same thing could apply there. That's
22 why I am saying as we move forward, as we look at the
23 competitive bidding process, we really want to get all
24 of the information we can to balance that off versus
25 what we are doing today.

1 Q. We have been talking about sending
2 out, I guess, signals to the NUG industry and getting
3 information back, and your evidence is that just
4 dealing with that issue you feel that certainly in the
5 short term competitive bidding and open solicitation
6 will give you the same information that you need and
7 the same response from the profession; is that fair?

8 A. I didn't say that. I think open
9 solicitation and competitive bidding is a way of
10 communicating a need out there, whether -- and what the
11 type of need is. You may elect to go to a competitive
12 bid as opposed to open solicitation.

13 For instance, I believe that if there was
14 a requirement for a limited amount of megawatts, let's
15 say as an example 300 megawatts, you may want to use a
16 bidding process to get at 300 to ensure that you are
17 getting the most efficient projects meeting that 300
18 megawatts.

19 Q. Well, isn't it fair to say that with
20 a bidding process NUGs have an incentive to keep their
21 rate of return as low as possible and with an open
22 solicitation process exactly the opposite incentive is
23 there?

24 A. I would think that if the industry
25 was mature and had experience in dealing with the

1 business then that would be a potential issue.

2 Q. Wasn't your direct evidence to the
3 effect that the industry basically is mature?

4 A. Yes, we are now saying that the
5 industry is reaching a mature stage. That is correct.

6 Q. And if Hydro had a competitive
7 bidding process now NUG developers would have more
8 incentive to keep their rate of return low in order to
9 get their proposals accepted?

10 A. That is obviously what competition
11 does. Yes, that's correct.

12 Q. Just one last point before we move
13 on, Mr. Vyrostko.

14 You have indicated a couple of times that
15 Hydro has a moratorium on selecting processes -- on
16 selecting -- sorry, they have a moratorium on receiving
17 projects from the NUG industry. I assume you have that
18 moratorium because of the open solicitation process;
19 isn't that fair?

20 A. No. Currently, why we have the
21 moratorium is we are changing the rules in the way we
22 are going to look at future projects, and rather than
23 accepting or continuing to accept projects under the
24 old rules we are just saying we are not going to accept
25 them until we have been able to identify the new rules.

1 Q. Well, isn't it fair to say at least
2 one of the reasons the rules are changing is because of
3 this situation?

4 A. Which situation?

5 Q. What we have been talking about, the
6 open solicitation, the fact that you have received so
7 many bids, and if you had a competitive bid situation
8 perhaps this wouldn't be occurring?

9 A. It's always, you know, easy to sort
10 of look back and see whether the decision that was made
11 is a right or wrong decision.

12 When we went with the open solicitation
13 the industry was not developed at all, and so
14 therefore, we felt that it was important that we allow
15 projects to happen to allow the industry come in and
16 prove whether in fact they can do the projects.

17 And now they are proving it, so now we
18 are at the stage of saying, okay, the open solicitation
19 has shown to us that there is an industry in Ontario
20 that is willing and able to provide electricity to the
21 system, and so now the question is: How do we now
22 proceed in the future?

23 Q. I have no difficulty with that, Mr.
24 Vyrostk. I guess the problem occurs with what our
25 definition of "future" is.

1 From what you have said it would seem to
2 me that what we would be looking at or what Hydro
3 should be looking at is the competitive bidding process
4 now as opposed to what you are saying in your
5 interrogatories and in your direct evidence, that the
6 open solicitation process will continue. It would seem
7 to me, based on what you have just said, that the
8 industry is maturing, that you want to go to the
9 competitive bidding process.

10 A. Again, I think we have now changed
11 the qualifications for projects, and these are projects
12 that now are considered what we believe to be high
13 efficiency cogen, and if we find that, for instance, we
14 are being either swamped with projects or we are in
15 fact not getting enough projects then we really have to
16 evaluate the process by which we are soliciting the
17 business.

18 I think the call that I am making right
19 now is that I believe with the change in the approach
20 that we are taking it is still appropriate to private
21 solicit as much business as we can because these are
22 important projects for us and I don't think that
23 competitive bidding is the way to go at this time.

24 Q. Mr. Vyrostkco -- I guess Mr. Brown
25 perhaps, the Chairman was looking at Exhibit 331B.

1 Perhaps we could turn to page 50A of Exhibit 340.

2 The Chairman and the Members of the Board
3 may have further questions. I just have one simple
4 question for you.

5 I was looking at Column B and Column D,
6 and in Column B you talk about a megawatt total and the
7 number of projects. In Column D you just talk about a
8 megawatt total and you don't have any number of
9 projects.

10 Is it possible for you to provide us with
11 the number of projects for Column D?

12 MR. BROWN: A. D is the same number of
13 projects as B. All we did was -- C and D is split out
14 of B.

15 Q. The first problem I saw -- I thought
16 that might be it, but then I looked at B and I noticed
17 for institutional and commercial and residential you
18 have one project at 7 and zero at zero. I know that's
19 a trivial example as there are obviously zero projects
20 for zero megawatts, but your evidence is that all the
21 rest of them are the same numbers for B?

22 THE CHAIRMAN: I don't think he means --
23 at least, I don't think he means that. Do you mean
24 that?

25 MR. BROWN: No. C and D is a split of B.

1 It just so happens in the example you picked there is
2 no overgeneration in that particular category, so that
3 one project is full of high-efficiency cogeneration, so
4 it's only going to be in C.

5 MR. WATSON: Q. Yes?

6 MR. BROWN: A. If we go to the
7 industrial, there are six projects there. There are
8 six in each side there. They are all above high
9 efficiency.

10 Q. Yes?

11 A. The only other one left is gas
12 compressor, and it is the same as industrial. It is
13 all above. So it is all -- all two projects are in
14 both C and D.

15 Q. So there are six projects composing
16 the 707, two composing the 240? Okay. Thank you.

17 Now, the 1,000 megawatts that has been
18 discussed before, you have indicated that a rate offer
19 has been accepted, but --

20 THE CHAIRMAN: I'm sorry, which 1,000
21 megawatts are we talking about?

22 MR. WATSON: The extra 1,000 megawatts
23 that increases the total from the 2,100 to the 3,100.

24 THE CHAIRMAN: All right. Thank you.

25 MR. WATSON: Q. Now, rate offers have

1 been accepted, but a contract hasn't been signed; is
2 that correct?

3 MR. BROWN: A. That's correct.

4 Q. Does that mean it is still in the
5 negotiating process?

6 A. That's correct.

7 Q. However, you expect them to be
8 committed, which means the contract is signed by the
9 end of the year?

10 A. Not all of them are expected to be
11 signed by year end.

12 Q. For these situations where the
13 developers have accepted rate offers, do all of them
14 have natural gas contracts signed?

15 MR. VYROSTKO: A. Generally speaking,
16 they would have gas contracts signed or they would have
17 letters of intent committing the producer to the gas
18 contract as agreed to.

19 Q. And if they have a gas contract
20 signed or a letter of intent, based on your knowledge
21 of the industry does that mean that there is pipeline
22 capacity available to meet the gas requirements?

23 A. Generally, those projects, because
24 they are looking at in-service dates of anywhere from
25 '94 to the end of '95, would have been in the queue and

1 would have identified their project within the required
2 three year lead time with TransCanada PipeLines.

3 Q. Now, based on your experience, would
4 you agree that industrial gas contracts such as this
5 contain provisions for firm gas and transportation?

6 A. You are saying that they contain
7 transportation elements and firm gas portions within
8 the gas contract?

9 Q. Yes.

10 A. Typically they would have that.

11 Q. If we could just move to the winter
12 peak for a minute, if we could. Assume an abnormally
13 cold year. Isn't it possible that these customers
14 could be interrupted?

15 A. That I am not aware of.

16 Q. Are you aware of whether there is a
17 hierarchy where gas is supplied to residential loads in
18 priority over industrial or other loads?

19 A. I understand that there is a priority
20 of customers within the gas system.

21 Q. And if in fact there is a hierarchy
22 and the industrial customers are not as high as the
23 residential customers it is possible that the
24 industrial customers could be interrupted under certain
25 circumstances?

1 A. Again, I don't know what the
2 contracts specifically would say for each of those
3 projects. The contract that we would have with them is
4 that they would provide electricity throughout the
5 entire period.

6 Q. Well, let's just have a hypothetical
7 for a second. Let's assume that something happens, gas
8 is interrupted in the winter peak. Are they going to
9 be able to generate power?

10 A. If gas was interrupted to them they
11 couldn't generate electricity.

12 Q. These 1,000 megawatts, they are not
13 expected to be dispatchable; is that correct?

14 A. I believe most of the projects have
15 curtailment clauses within a contract.

16 Q. But they are not dispatchable?

17 A. Curtailment is limited
18 dispatchability.

19 Q. Okay. It's one side of the coin?
20 Curtailment means that you can, in effect, shut a NUG
21 down or not use the NUG power, not buy it, but that
22 doesn't mean it is there when you need it; is that
23 fair?

24 A. On the basis of the way the contract
25 is negotiated and the delivery is negotiated by the

1 proponent, then the expectation would be that the
2 proponent meets his delivery pattern. That delivery
3 pattern typically would reflect the importance of being
4 on our peak throughout the year.

5 Q. I know that's your expectation and
6 I'm sure it is a NUG producer's expectation because
7 they will get paid for the power they produce.

8 But to reduce it to very simple terms,
9 you can turn on a switch and get power from a Hydro
10 facility, and that is in effect dispatchability.

11 [10:20 a.m.]

12 You can't necessarily turn on a switch
13 and get the power from a NUG, however you can turn off
14 a switch and take a NUG out of a system and that's
15 curtailment, and that's the difference between the two;
16 isn't that fair?

17 A. When we look at projects, even going
18 back to the Hydro system, I think there are projects
19 that we look at as being base load operations and there
20 are others that we look at something other than base
21 load. A base load plan typically would be the latter
22 example that you used. The switch would normally be on
23 and you would only turn it off when in fact it's not
24 necessary, and typically that's how we see most of
25 these NUGs. That currently they are base load and so

1 therefore they would always be on and we would turn
2 them off when we didn't need them.

3 Q. I don't want to make too much of
4 this, but you are talking expectations, that's what you
5 hope. The point is the control doesn't rest with
6 Hydro.

7 A. The control does not rest with Hydro,
8 that's correct.

9 Q. Now, you were talking in your
10 evidence earlier about curtailment and you said that
11 that would occur especially when nuclear was on the
12 margin; is that a fair summary of your evidence?

13 A. I'm not sure if I said that. I
14 believe what I said was that curtailment occurs when
15 power isn't required and that's typically in the summer
16 time off-peak.

17 Q. Mr. Vyrostkco, if you could look at
18 Volume 72 of the transcript, please.

19 A. Yes.

20 Q. It's page 1370. The second full
21 paragraph starting with the words, "Now we often," and
22 continues.

23 "Now, we often have in our non-utility
24 generation contracts a clause that does
25 allow some curtailment during hours of

1 surplus base load generation. That is
2 when hydraulic generation or nuclear
3 generation is the marginal fuel. And so
4 we do have some limited contractual
5 ability to cut back in these
6 circumstances."

7 So, we are talking about curtailment when
8 nuclear is on the margin.

9 MR. SNELSON: A. I believe that was my
10 reply, Mr. Watson.

11 Q. Okay.

12 A. And surface base load generation is
13 when nuclear and hydraulic capacity available and any
14 other low cost generation exceeds the load. And in
15 those circumstances, our usual choice is to cut back on
16 the nuclear generation.

17 Q. Okay. Now, does curtailment apply to
18 all NUGs?

19 MR. VYROSTKO: A. No, it does not.

20 Q. Is there something that explains to
21 us when curtailment applies and when it doesn't?

22 A. Curtailment is one of the options
23 that we have been trying to negotiate with developers
24 to get some form of dispatch into the contracts. So,
25 recently, I would say within the last year, as we have

1 been negotiating projects, we have been asking for some
2 forms of curtailment and we have been successful in
3 getting that in our recent contracts.

4 Q. So this isn't a Hydro policy, it's
5 one of the items that you negotiate?

6 A. It's not Hydro policy, but it's a
7 desire from a system perspective to have dispatch for
8 operating flexibility and we are now trying to get that
9 through our contracts.

10 Q. Okay. I assume as this is in the
11 negotiation process, there must be some compensation or
12 some other benefit if NUGs agree to be curtailed?

13 A. NUG projects, NUG contracts have
14 value to us, have more value to us if they in fact can
15 be dispatched or curtailed, and so we try to get that
16 into our contract.

17 Q. And if you try and get it into the
18 contract, then you would reflect that in some benefit
19 or some way to the NUG developer?

20 A. In some cases the way we would
21 reflect that is in negotiating and concluding with the
22 contract. By having some flexibility in it, in overall
23 operation, then that project can come in within our
24 avoided cost.

25 Q. It would seem to me that curtailment

1 is important from a system point of view. How do you
2 determine which unit should get curtailed and which
3 should not? Isn't it a function of where they are in
4 the system, the size, what type of NUG they are, aren't
5 all of those things important from a system point of
6 view?

7 MR. SNELSON: A. From a system point of
8 view, Mr. Watson, there are requirements for security
9 and safety purposes, which are covered in contracts.
10 i.e., if the operation of a non-utility generator were
11 to endanger the employees or public, or were to
12 endanger the reliability of the system, then in all NUG
13 contracts we have the ability to cut back under
14 circumstances and that is separate from the
15 curtailment. The curtailment is the ability to do it
16 for essentially an economic reason.

17 Q. You are talking about economic
18 reasons, Mr. Snelson, is heat rate reflected in that?

19 A. Can you be more specific?

20 Q. Well, simply if you have a lower heat
21 rate, are you more likely to not be curtailed? If you
22 are lower heat rate you are more efficient, hopefully
23 better for the system and the province as a whole,
24 therefore you should be on and others which have a
25 higher heat rate should not be. Is that one of the

1 criteria?

2 A. I believe the limitation on
3 curtailment contractually is with respect to the number
4 of hours per year that they can be curtailed.

5 Q. Can you give us some idea of what are
6 the hours?

7 MR. VYROSTKO: A. We have contracts in
8 the order of 600 hours.

9 Q. Is that 600 hours at any time or is
10 it 600 hours in certain seasons?

11 A. It's typically 600 hours during the
12 summer period.

13 Q. Is that a maximum figure?

14 A. It's a negotiated figure.

15 Q. We are talking about nuclear being on
16 the margin, and I reproduced some excerpts from the DSP
17 on pages 51 and 52. Mr. Snelson, you are very familiar
18 with the chart on page 52, you referred to it many
19 times. In effect it shows that nuclear is on the
20 margin 11 per cent of the time in the year 2000 and
21 that's reflected at page 51.

22 Now, Mr. Vyrostk, you are saying 600
23 hours in the summertime, if nuclear is on the margin 11
24 per cent of the time, that amounts to just roughly
25 about 900 hours.

1 Do you think NUGs would agree to a level
2 of curtailment like that?

3 A. Again, we are trying to develop a
4 guideline for curtailment or dispatch with NUGs and
5 trying to in fact develop a reflection of the economic
6 value that dispatch or curtailment has to us, and that
7 we try to work with each proponent as we negotiate
8 contracts.

9 Q. Do you have a contract with 900 hours
10 in it, curtailment?

11 A. Specifically for curtailment, no.

12 But just one other element in the
13 contract, that typically we discuss with the generators
14 as to planned outages and we try to plan them with our
15 own system.

16 Typically the planned outage would occur
17 in the summertime as well, and so when you add the
18 planned outage and the 600 hours of curtailment, you
19 could be approaching 900.

20 Q. Mr. Brown, is curtailment accounted
21 for in the cogeneration feasibility model?

22 MR. BROWN: A. Not in the feasibility
23 model. It's included in the calculation of the energy
24 contribution from NUGs.

25 Q. Now, we have had some discussion

1 about committed projects. Assuming these thousand
2 megawatts of projects are committed in the near future,
3 I know that not all of them will be this year but in
4 the near future, is it fair to say there is still a
5 number of permits, licences and reviews that are
6 required before the plant can be built?

7 MR. VYROSTKO: A. That's correct.

8 Q. Do you have a report or an
9 interrogatory or anything which lists all of the
10 reviews that a NUG has to go through?

11 A. There are a number of interrogatories
12 that we have provided that talk about some of the
13 permits and licences that are required. As an example,
14 Interrogatory 5.4.1, which I believe attached our
15 request for proposal, in that request for proposal
16 document it identifies a number of permits and licences
17 that we believe the proponents would have to consider
18 as they submit their proposed projects.

19 THE REGISTRAR: Could I have that number
20 again, please?

21 MR. VYROSTKO: 5.4.1.

22 THE REGISTRAR: That will be 321.51.

23 THE CHAIRMAN: Thank you.

24 ---EXHIBIT NO. 321.51: Interrogatory No. 5.4.1.

25 MR. WATSON: Q. Mr. Vyrostk, you used

1 the word "some", do you mean that that is not a
2 complete list, there may be other things that are not
3 on that list?

4 MR. VYROSTKO: A. Our responsibility is
5 not to try to identify necessarily the entire listing
6 of requirements.

7 What we try to do is assist the proponent
8 in directing them to the appropriate ministry for
9 proper identification of all the permits and licences.

10 Q. No, I wasn't suggesting it was your
11 responsibility. I just wondered if you had something
12 that we could look at. 5.4.1 is as close as you have?

13 A. That's pretty well the list that we
14 have, correct.

15 Q. Now, I suppose it's always possible
16 that projects facing these lists of licensing or
17 permitting requirements could run into difficulties?

18 A. That's a possibility, yes.

19 Q. I suppose the range of options are
20 they could either stop the projects or slow their
21 development, and if they did the latter, it would
22 certainly increase the cost to the developer; is that
23 fair?

24 A. That's correct.

25 Q. We know that environmental issues are

1 becoming a much larger concern to the province than
2 they have been in the past. Isn't this also a
3 situation where we could increase the likelihood that
4 certain committed NUG projects would face problems?

5 A. There could be the possibility where
6 some of the committed projects could run into problems.

7 Q. Doesn't this particularly apply to
8 the major supply NUGs?

9 A. I can't make a judgment as to whether
10 it applies there more than anywhere else.

11 Q. Mr. Vyrostk, in the RFP process, I
12 assume Hydro did not set out to encourage MS NUGs,
13 major supply NUGs; is that fair?

14 A. I think when we initiated the request
15 for proposal, we were looking at any non-utility
16 generator that was economic and that could in fact
17 didn't meet all the requirements.

18 [10:35 a.m.]

19 Q. I assume it's undesirable for Hydro
20 to accept an unlimited number of major supply NUGs, is
21 that correct?

22 THE CHAIRMAN: Did you say "undesirable"?
23 Is that what you said?

24 MR. WATSON: Yes.

25 MR. SNELSON: Essentially the amount of

1 generation we need is determined by system
2 requirements, and so that would put a limitation at
3 some point on the amount of major supply NUGs that we
4 need.

5 MR. WATSON: Q. I also understand
6 certainly one of the purposes of RFP No. 1 was to
7 encourage the development of renewable resources and
8 cogeneration, isn't that fair?

9 MR. VYROSTKO: A. Again, I believe it
10 was intending to try to encourage all forms of
11 non-utility generation to stimulate the industry.

12 Q. Which would include renewable
13 resources and cogeneration?

14 A. It would include those as well.

15 Q. And, in effect, that just didn't
16 happen, did it?

17 A. In terms of the renewables, we didn't
18 get as many proposals as possibly some people would
19 have thought, but I think our results show that more
20 than half of the request for proposals, proponents were
21 putting projects in that were cogeneration.

22 Q. But a lot of those would be oversized
23 cogen?

24 A. As it turned out they were larger
25 cogen opportunities. That's correct.

1 Q. And it's probably fair to say that an
2 oversized cogen unit is virtually the same as a major
3 supply NUG, isn't it? Certainly the oversized part?

4 A. We are looking at and we have said
5 that our preference is for those projects that are
6 thermally balanced or high-efficiency cogen. And so if
7 there was a categorization of the type of projects that
8 we would today want, the high-efficiency cogen would be
9 preferred over the other type of cogeneration.

10 Q. Panel, if we could just look at a
11 combined-cycle plant for a minute.

12 Now a combined-cycle plant built as an MS
13 NUG would be the same as one built by Hydro, is that
14 fair?

15 MR. SNELSON: A. In general principle,
16 yes, the detailed selection of size or equipment might
17 be different. In general principle, yes.

18 Q. Well, both would face the same
19 natural gas prices, isn't that fair, or could Hydro
20 negotiate a better deal because of its size?

21 A. I couldn't comment on what
22 differences there might be in terms of our ability to
23 negotiate gas contracts.

24 Q. What about the ability to purchase
25 equipment? Is it fair to say that Hydro could get at

1 least the same rate as a private developer, if not
2 better?

3 A. I couldn't comment on that either.

4 Q. I assume both would create the same
5 emission levels, the same needs for transmission?

6 A. The needs for transmission will be
7 dependent upon location and given the same location
8 they would have the same effect on transmission, same
9 location and size.

10 The other part of the question? There
11 were three parts, I think.

12 Q. The emissions levels. They would be
13 the same for the same plant, I assume?

14 A. If the same control measures were
15 used you would expect them to be the same.

16 Q. And they may because of Hydro's
17 position and the current state of the law, the Hydro
18 emissions could be less, isn't that fair?

19 A. I don't think we have any particular
20 evidence of that.

21 Q. Of course another difference would be
22 that there would be a rate of return paid to a NUG
23 developer, but that wouldn't apply in the Hydro case?

24 A. The financial arrangements would be
25 different.

1 Q. Yes. Also Hydro would have control
2 over dispatching the project, but it wouldn't have
3 control over a NUG project?

4 A. It would have control over the
5 dispatch of the project subject to whatever terms and
6 conditions, whatever constraints were put on
7 dispatching from the fuel contract.

8 Q. It wouldn't have the same
9 dispatchability that it would have over it's own plant?

10 A. I'm sorry?

11 Q. It wouldn't have the same
12 dispatchability for a major supply NUG that it would
13 have for its own plant?

14 A. One would expect the dispatchability
15 to be at least as good from the Ontario Hydro plant as
16 from the major supply NUG, but there may be constraints
17 on dispatching of the Hydro plant if it was necessary
18 to enter into some sort of fuel contract.

19 Q. Well, we were talking earlier about
20 dispatchabilities, Mr. Snelson. I mean, you're
21 assuming that NUGs are non-dispatchable. You don't
22 make that assumption on your plants, isn't that
23 correct?

24 A. That is not normally the case but,
25 for instance, we use natural gas in the Hearn

1 Generating Station in the 1970s, and the terms of the
2 gas contract required us to take increased volumes in
3 the summer compared to the winter because that was what
4 suited the gas system, and so the terms of the fuel
5 contract can affect the dispatching of the electricity.

6 Q. No doubt about that, Mr. Snelson.
7 You're not going to argue with me that that same
8 restriction would apply to a NUG, and if anyone is
9 going to be able to negotiate with the gas people, I
10 assume you would be able to do it as well as NUG
11 developers, if not better, so the situation that you're
12 talking about in the 70s, in fact, may not apply today?

13 A. I'm sure the situation today is
14 different, but my only point is that the, to get
15 commitments of gas for a generating plant, it may be
16 necessary to guarantee that certain volumes of gas are
17 taken, and may be taken in certain time periods, and
18 that would constrain the dispatch of a plant whether it
19 was owned by Ontario Hydro or by a non-utility
20 generator, but I do agree that the dispatch of an
21 Ontario Hydro plant would be at least as flexible as
22 the non-utility generating plant.

23 Q. I assume Hydro does not have any
24 control over outside conditions which would cause a NUG
25 project to be abandoned in the future?

1 A. I'm sorry, I don't...

2 Q. Such as economic conditions, things
3 like that? A NUG project may have to be abandoned in
4 the future for any number reasons, and Hydro would have
5 no control over that?

6 MR. VYROSTKO: A. There are situations
7 where if a project were to be abandoned in the private
8 sector our contract would say that we would have rights
9 to the plant, so there are some cases where we have
10 been able to negotiate that.

11 Q. If you had rights to the plant,
12 especially with something like a cogeneration plant,
13 you might be in a position where it would be probably
14 more expensive for you to run that plant than the NUG
15 developers, isn't that fair?

16 A. I couldn't make that judgment.

17 Q. Okay. Is it fair to say that Hydro
18 projects are at least reliable or more so than the
19 major supply projects?

20 A. I would think it depends on the
21 circumstance and on the actual project itself. There's
22 utility projects that are more reliable. There are
23 non-utility generation projects that are more reliable
24 so it depends on the particular circumstance and the
25 station.

1 Q. Mr. Vyrostko, I believe your evidence
2 was that Hydro is better suited to building bigger
3 projects, and the NUG developers have a niche in
4 dealing with the small projects. Is that a fair
5 summary?

6 A. As long as we qualify what "large"
7 and "small" means, yes, that's a fair assumption.

8 Q. That's precisely what I wanted to do,
9 Mr. Vyrostko.

10 If you look at page 53 of Exhibit 340, we
11 have page 14-19 of Exhibit 3, and if you look at the
12 bottom of the middle column they're talking about the
13 configuration of units, and the second and third refer
14 to a 150 megawatt CTU and a 660 megawatt combined cycle
15 and integrated gasification combined-cycle unit. Then
16 if you look over at the left-hand column, in the last
17 paragraph just above the heading, "System Application",
18 and the paragraph that starts, "For optimal
19 integration...", the second sentence they're talking
20 about for Option 6, 7, 8, and 9, the first phase of
21 each 660 megawatt unit comprises three 150 megawatts
22 CTUs, and the second phase comprises one 210 megawatt
23 heat recovery steam generator, so we see we have a
24 number of 150 megawatt CTUs that Hydro is interested
25 in, and we know from what Hydro is seeking in its plan

1 approvals that combined cycle, IGCC and CTUs play an
2 important part of the plan, is that fair?

3 A. Yes, that is fair.

4 Q. So 150 megawatts CTU units also play
5 an important part in the plan?

6 A. That is correct.

7 Q. Now, if Hydro was contemplating
8 building a number of these 150 megawatt CTUs, then
9 dealing with Mr. Vyrostkco's question, it would seem to
10 me that 150 megawatt unit is something that Hydro feels
11 comfortable doing, and if that's the situation, why
12 shouldn't Hydro be making the units that are above 150
13 megawatts, and the precise example is the 350 megawatt
14 and the major supply note.

15 MR. BROWN: A. Just to start with we're
16 using different terminology here. The 150 is only one
17 part of the station. It is one unit in the station of
18 660 megawatts. In a NUG of 350 or 250 there may be
19 CTUs that could be 50/60 megawatt sizes and not 150
20 megawatt sizes, so there still is a size differential
21 that with we have seen to date in projects. The 350
22 megawatt major supply NUG isn't one unit at 350
23 megawatts.

24 Q. No, I'm aware of that, Mr. Brown, and
25 in the same way you're,...

1 A. Is not. Probably 4 or 5 units.

2 Q. Okay, in the same way that your 660
3 megawatt combined-cycle plant isn't a 660 megawatt
4 unit. It is composed of a number of 150 megawatt
5 units. So do I take it your evidence is that the 350
6 megawatt unit does not have any CTUs that are near the
7 150 mark?

8 A. I can't get into the project design.
9 In general, the NUGs are using smaller CTUs than as
10 proposed by Hydro.

11 Q. Is it fair to say then, and I
12 appreciate that you don't want to get into the specific
13 project design, but is it fair to say that if a
14 proposal came forth in the 150 megawatt range, that
15 that is something Hydro would consider building as
16 opposed to something that should be left to the private
17 sector?

18 MR. SNELSON: A. I think the thrust of
19 our direct evidence is that where you are into a major
20 supply NUG, and this is in the future, in the future
21 when you're into major supply NUGs which would use
22 combined-cycle technology, or combustion turbine units
23 similar to the technology that Ontario Hydro would use,
24 and size is not the sole criterion here, that the
25 process we're intending to follow is to determine what

1 our need is for that sort of technology, and then see
2 about what is the best way of implementing that. So
3 we're leaving the question open in this process as to
4 whether future combined cycle type of plants should be
5 built by Ontario Hydro or by a non-utility generator,
6 and I don't think we have settled exactly how that
7 process will be resolved.

8 [10:50 a.m.]

9 THE CHAIRMAN: But you have never done
10 this before, anything like this before?

11 MR. SNELSON: We have, as we have said,
12 taken on a non-utility generator that is a major supply
13 NUG in the 350 megawatt project that's been discussed.

14 We have not previously gone through a
15 process of trying to -- and having said that we need
16 that sort of technology, of trying to decide who should
17 do it, Ontario Hydro or the non-utility generator.

18 THE CHAIRMAN: But historically in
19 deciding who would do it, there was no question that
20 Hydro would do it.

21 Now, there is a new policy or attitude,
22 whatever you want to call it, that you would consider
23 whether Hydro does it or whether you arrange for
24 somebody else to do it.

25 MR. SNELSON: That is correct.

1 THE CHAIRMAN: I take it there is no
2 limit on that. Conceivably it could be a very large
3 plant?

4 MR. SNELSON: Yes, I believe there is no
5 particular limit on that.

6 I think there are also degrees of private
7 sector involvement in that it is possible, for
8 instance, to have the private sector design and
9 construct a plant to a general specification by Ontario
10 Hydro and then Ontario Hydro would just buy it as a
11 finished and working plant. That's called a turnkey
12 project.

13 THE CHAIRMAN: You have done that before?

14 MR. SNELSON: That's been done. So there
15 are a variety of sort of arrangements that can be
16 introduced.

17 MR. WATSON: Q. Mr. Snelson, as you can
18 appreciate, my client is quite interested in this. Can
19 you give us some idea of when Hydro is going to have a
20 policy on this, what criteria are going to be included
21 in this policy, what stage you are at in developing
22 this process?

23 MR. SNELSON: A. I think we are at a
24 very early stage in developing this process.

25 The stage we are at is that we have

1 recognized that because of the parallel nature of these
2 sorts of technologies between what the private industry
3 can do and what Ontario Hydro can do that we need to
4 co-ordinate the planning better, that the planning
5 needs to recognize that when you have an
6 electricity-only generating plant then it should be
7 designed and operated in step with the electricity
8 system requirements, whereas when you come to the
9 dual-purpose plants, like the cogeneration plants and
10 waste-burning plants, the design and the operation is
11 as much determined by the other use of that facility as
12 it is by the electricity system.

13 So we do need in these -- of course, we
14 recognize that we need to have better co-ordination of
15 planning, better co-ordination of operation, and better
16 definition of dispatchability for this type of
17 facility, but we haven't as yet gone very far in the
18 direction of defining exactly how to do that.

19 Q. Now, Mr. Snelson, for all of those
20 very important reasons that you have mentioned wouldn't
21 it be fair to suggest that Ontario Hydro should refuse
22 these major new supply NUGs, especially, as the
23 Chairman said, that they could be of any value -- any
24 amount, until you have this policy in place, until you
25 have the criteria, so that you can ensure that there

1 are no problems with the system, some of which you have
2 identified?

3 MR. VYROSTKO: A. I believe that's the
4 position that we have actually taken now with respect
5 to the changing approach to our business, that we are
6 now trying to encourage only the preferred NUGs and
7 renewables in the future.

8 Q. I understand what you are trying to
9 encourage. My question was a little bit more focused,
10 though.

11 I was suggesting that perhaps Ontario
12 Hydro should now refuse to have any more of these
13 projects until this very important policy with its
14 accompanying criteria is in place.

15 A. You mean preferred NUGs?

16 Q. No, I mean major supply NUGs.

17 A. I think the way our business is going
18 forward with the redefinition, we probably won't see
19 any major supply NUGs in the near future, and that as
20 previously stated if there is a system requirement in
21 the future for additional supply, then by then we
22 should have enough information and we should have
23 our -- the guidelines identified such that we can then
24 go out in an organized way to acquire major supply, if
25 that were to be the case.

1 Q. I understand that, Mr. Vyrostko, that
2 is your expectation, but I guess what you are telling
3 me is that you cannot assure my client that these
4 projects will not go on the system until that policy
5 and its criteria are in place.

6 A. Perhaps we can talk about that after
7 we have made our announcement to the proponents
8 tomorrow on what the guidelines are because I would
9 suspect that some of that information would, I think,
10 give your client some reassurance that they won't come
11 on stream.

12 Q. Thank you, Mr. Vyrostko. I have
13 added that to my "after Friday" list.

14 THE CHAIRMAN: Would you like to break
15 now?

16 MR. WATSON: This would be an appropriate
17 time, Mr. Chairman. I can tell you that I am
18 progressing faster than I thought I was going to
19 progress. I am sure we will be finished today well
20 before four o'clock.

21 THE CHAIRMAN: Thank you. We will
22 adjourn now for 15 minutes.

23 THE REGISTRAR: This hearing will adjourn
24 now for 15 minutes.

25 ---Recess at 10:56 a.m.

1 ---On resuming at 11:15 a.m.

2 THE REGISTRAR: This hearing is again in
3 session. Please be seated.

4 Mr. Chairman, Interrogatory 5.14.221, I
5 note, has previously been entered and given the number
6 321.26. I inadvertently, earlier this morning, gave it
7 another number, 321.49. As we have gone beyond 49 to
8 321.51, with your permission I would like to hold 49
9 vacant for the next interrogatory to come up.

10 THE CHAIRMAN: That will be fine.
11 Actually, in the listing, the printed listing, it is
12 shown, 26, as 5.4.221, and that was perhaps why that
13 occurred.

14 THE REGISTRAR: I regret the error.

15 THE CHAIRMAN: I should also take the
16 opportunity to just note for the record three exhibits
17 that have been filed all by the Board.

18 The first is Exhibit 337, which is the
19 summary of the site visit to the Moose River/James Bay
20 area to Kapuskasing, which occurred in the early part
21 of September.

22 Exhibit 338 are the written submissions
23 that were made to the Panel during those site visits,
24 and Exhibit No. 339 is a petition that was presented to
25 the Panel at Moose Factory during those site visits.

1 ---EXHIBIT NO. 337: Summary of site visit to Moose
2 River/James Bay area to Kapuskasing,
in early September.

3 ---EXHIBIT NO. 338: Written submissions to the Panel
4 during site visit of Exhibit 337.

5 ---EXHIBIT NO. 339: Petition which had been presented
6 to Panel during site visit of Exhibit
337.

7 THE CHAIRMAN: So those are put on the
8 record.

9 And now, Mr. Watson?

10 MR. WATSON: Thank you, Mr. Chairman.

11 Q. Before moving on, I would like to
12 clear up one matter.

13 We were talking about the 1,000
14 megawatts, and I believe your evidence was that you did
15 not think all of the contracts would be signed by the
16 end of this year; is that correct?

17 MR. BROWN: A. All the rate offers,
18 that's correct.

19 Q. Hydro's definition of "committed
20 projects" is when the contract is signed?

21 A. That's one way it can be committed.

22 Q. I guess where my concern arises is
23 if -- and I don't have the copy of this. It is Exhibit
24 319, which is the supplementary witness statement,
25 paragraph 7, and I will read paragraph 7 as it is

1 short:

2 Currently the NUG industry has 73
3 committed and in-service projects,
4 totalling 718 megawatts of electricity
5 generation, with an additional 1,000
6 megawatts expected to be committed by the
7 end of this year.

8 When I saw the word "committed" I
9 remembered the earlier evidence and I thought
10 "committed" meant "signed contracts". Is there
11 something I am missing, Mr. Brown?

12 A. No, we expect to get a 1,000
13 megawatts of contracts signed by the end of the year.

14 What is a little bit confusing is there
15 are projects already in the committed list in the 718
16 that haven't got a signed contract. They have been
17 committed for other reasons, as I mentioned. Signing a
18 contract is only one reason why we would commit a
19 project.

20 Q. So for those projects which are
21 committed which don't have contracts you are still in
22 the negotiation phase with these developers?

23 A. It is still under negotiation and
24 they are still getting required approvals.

25 THE CHAIRMAN: Just so I understand it,

1 in what circumstances would you regard an arrangement
2 to be committed when there was no signed contract?

3 MR. BROWN: If the developer has
4 committed to the project with a large financial
5 commitment, such as he has ordered his equipment or
6 started construction or started a draw down on his
7 financing, then we would now call it a committed
8 project.

9 MR. WATSON: Q. Now, Mr. Brown, how many
10 of those "committed but no contract" situations exist?
11 Can you give us a rough idea of the number of
12 megawatts?

13 MR. BROWN: A. Roughly about 200
14 megawatts.

15 Q. I would assume that if a developer is
16 committing resources is it fair to say that is probably
17 a cogeneration project?

18 A. It could be small hydro.

19 MR. WATSON: Mr. Chairman, Members of the
20 Board, I had a number of questions I was going to
21 pursue on another aspect of avoided cost, in particular
22 project appraisal, system incremental costs, and how
23 they fit in in other areas.

24 Based on the evidence that the Panel gave
25 yesterday I also will include that in my "after Friday"

1 list and come back in re-cross-examination and deal
2 with that, depending on what happens on Friday.

3 Q. Now, Panel, if you would look at page
4 55 of Exhibit 340 we again have an excerpt from Exhibit
5 319, and if you would look at the bottom paragraph,
6 paragraph 27, that talks about the surplus, and you
7 indicate that there would be a surplus for a few years
8 around the year 2000.

9 Is it fair to say that part of that
10 surplus is going to exist before the year 2000?

11 MR. SNELSON: A. To some degree, yes.

12 Q. And is it fair to say that one of the
13 concerns about NUGs is that they create a less than
14 optimal resource mix?

15 A. In what sense were you using the word
16 "optimal"? I'm sorry, I am going to need that
17 clarification to be able to answer the question.

18 Q. Well, I didn't think it was going to
19 be a difficult question.

20 Perhaps you could turn the page to page
21 56 of Exhibit 340. Paragraph 5, the last line, refers
22 to some NUG disadvantages -- the last sentence refers
23 to some NUG disadvantages in the last line. It says:

24 Less flexible operation and less
25 optimal long-term resource mix.

1 A. I think that one of the concerns that
2 is being discussed in that particular paragraph is that
3 we are concerned that we have a reasonable balance of
4 different sorts of energy sources on the system from
5 both an economic point of view and also from a sort of
6 resource use and diversity point of view.

7 And with a forecast of rising real
8 natural gas prices, then we are concerned about the
9 degree of dependence that we may generate on natural
10 gas if we go to very large quantities of natural
11 gas-fired generation, and NUGs are currently offering a
12 lot of natural gas-fired generation.

13 Q. Most of it is; isn't that fair?

14 A. Except for the waste and small hydro,
15 yes.

16 Q. And they're a very small component?

17 A. They're quite small.

18 Q. Is it fair to say that NUGs don't
19 necessarily meet the supply requirements in terms of
20 both energy and demand?

21 A. NUGs generally operate according to
22 the contractual terms that we negotiate with them, and
23 we try to get some match between the supply
24 requirements and the terms we negotiate.

25 Q. Mr. Vyrostko, when you were

1 discussing negotiations earlier you indicated that
2 Hydro is taking a risk on natural gas price escalation
3 factors. You also indicated that this could be
4 reflected in the purchase price which was offered to
5 NUGs.

6 First of all, is that a fair summary of
7 your evidence?

8 MR. VYROSTKO: A. Yes, we have taken gas
9 price risks.

10 Q. Okay. Could you please explain to us
11 precisely how you factor this risk into the purchase
12 price? Are there any criteria? Is there any policy?

13 A. Basically, what we do is negotiate
14 the project such that if we were to take gas price
15 risks, the opportunity and the cost of that gas price
16 risk is offset by an equal gas price benefit to the
17 ratepayers, and so anytime we take on a risk it is
18 always matched with an offsetting benefit that we can
19 earn.

20 Q. Looking at the general concept of
21 risk isn't it fair to say that increasing risk usually
22 commands some sort of increasing return or increasing
23 benefit, and wouldn't that be appropriate in this type
24 of situation?

25 [11:30 a.m.]

1 A. Again, if we are taking on risks we
2 would then be expecting the appropriate or offsetting
3 benefits.

4 Q. So can you be that precise in your
5 negotiations that you say that if you identified this
6 area of risk, you can match a corresponding benefit to
7 that risk?

8 A. Typically, the risk in the contract
9 is on the long-term price of gas.

10 In the early stages, a year ago, when we
11 were negotiating with proponents, there was a concern
12 that the price of gas would escalate faster than other
13 forecast and other people's expectations. Therefore,
14 to try to have cover off that uncertainty with the
15 developer, what we basically said is we would be
16 prepared to consider reopeners in the gas contract such
17 that if there were to be this expected high price
18 increase, some of the increase would be picked up by
19 us. It's a shared risk between ourselves and the
20 developer.

21 In all cases there would be a cap that
22 would be discussed, so it's not unlimited; there is a
23 cap set to that. And then the overall measurement of
24 the project is the project avoided cost.

25 Q. Okay, Mr. Vyrostko, you were

1 mentioning that a year ago there was concern about the
2 gas price forecast. We have heard a lot so far about
3 the low prices of gas today. Is it fair to say that
4 that concern is no longer there?

5 A. In the latest contracts that we have
6 been seeing that is not there. The gas industry is
7 prepared to go with fixed price escalation without any
8 concern for these reopeners, that's correct.

9 Q. So Hydro is not taking risks on
10 current contracts?

11 A. Again, the trend now is that we can
12 get gas without taking any of the price reopener risks.
13 To say that there isn't any risk being taken, it
14 depends on the contract specifically. So there may be
15 some cases where we still are looking at some type of
16 risk.

17 Q. So what it boils down to, it is just
18 a simple negotiation process. There are certain risks
19 that the NUG will try and off load on you, and you will
20 require certain benefits in return. And there is no
21 policy or criteria for matching these things, it is
22 just a matter of your overall judgment in negotiating
23 the total package; is that fair?

24 A. I don't think that that's fair.

25 The reason for the balancing and the

1 trading off of risk is to make the project economic.
2 To make those projects viable.

3 So typically if the project can get
4 within avoided cost without any risk on either party,
5 then that's exactly what we go for. If in some cases
6 we would take the risk, for instance, of front end
7 loading where we would pay a little bit more at the
8 front end and pay a little less at the back end to make
9 the project economic, we will do that, so that's again
10 in some cases. We will consider the risks and the
11 benefits to, in fact, make projects economic.

12 Q. But you have no criteria or no
13 policy. What you are talking about is your overall
14 judgment and your experience in negotiating contracts,
15 and all of that is factored in to come up with an
16 acceptable package.

17 A. No, we do have an operating guideline
18 that we work towards to provide the bounds by which we
19 would take on a risk where we would do any of the
20 negotiations.

21 Q. Is that a public document?

22 A. No, it's not.

23 Q. I don't want you to tell me any
24 specific terms of this policy if you feel that it is
25 confidential, Mr. Vyrostk, but can you give us some

1 idea as to whether there is a particular set of
2 trade-offs or criteria mentioned in the policy such
3 that if you accept a certain amount of risk, that would
4 have a certain translation over to the avoided cost, or
5 some other type of criteria?

6 A. That guideline is not that specific
7 with respect to trying to determine exactly what value
8 of risk there is.

9 I think the value of risk has to be
10 looked at as a judgment when you negotiate. But there
11 are guidelines in there with respect to, for instance,
12 how much front-end loading one would go for to ensure
13 that there is enough opportunity at the back end of the
14 contract to get the payments coming back. There are
15 guidelines with respect to, for instance, how much
16 guaranteed payments would you accept and how long would
17 you allow those guaranteed payments to continue with
18 respect to a contract. It talks about generally how
19 much exposure that the corporation should expect when
20 they are looking at a project. But most of those are
21 not specific hard numbers because it varies from
22 project to project. And the bottom line requirement is
23 always that we work towards the project avoided costs.

24 Q. Panel, if you could turn to page 62
25 of Exhibit 340. I understand that is a press release

1 from Ontario Hydro dealing with independent power,
2 dated July 11th, 1991. And if I could refer you to the
3 fourth paragraph starting with the words, "The
4 program." It reads:

5 The program is designed to encourage
6 new non-utility generation, especially
7 load displacement projects.

8 Then if I refer you to the paragraph
9 below that. It says:

10 In the past, purchase projects have
11 received financial assistance in special
12 circumstances as approved by Hydro's
13 Board of Directors, however, the new
14 program makes a flexible package of six
15 financial assistance options a regular
16 part of the services offered by Hydro's
17 non-utility generation division.

18 Do all of the six financial assistance
19 options which are mentioned there apply to load
20 displacement non-utility generators?

21 MR. BROWN: A. They are not as specific
22 as purchase or load displacement, but a load
23 displacement generator could take advantage of any one
24 of those six.

25 Q. What about a municipal utility?

1 MR. VYROSTKO: A. Yes.

2 Q. So will load displacement generators
3 receive financial assistance up to the point where they
4 are being paid the full project appraisal avoided cost?

5 A. Yes, they can.

6 Q. Is that the same situation for
7 municipal utilities?

8 A. If a municipal utility were to put a
9 project forward then they would have the opportunity to
10 take advantage of any of these programs.

11 Q. I understand one of the six financial
12 assistance options is a low interest loan program; is
13 that correct?

14 MR. BROWN: A. That's correct.

15 Q. And that low interest loan is given
16 by Hydro to the proponent?

17 A. Yes.

18 Q. I believe the choice is up to the
19 developer or the proponent whether they will avail
20 themselves of this option.

21 A. They have to ask for it. We may not
22 release it.

23 THE CHAIRMAN: I am sorry, I didn't
24 follow that. What do you mean by release it?

25 MR. BROWN: We have criteria we look at

1 before we would offer a loan to somebody, such as a
2 technical review or financial review.

3 In a lot of cases the developers aren't
4 looking for loans so we don't go offering it to them.
5 But if they ask for a loan then we have to do more
6 homework, equivalent to what a bank would be doing to
7 check out a loan.

8 THE CHAIRMAN: But these six programs are
9 known programs, I take it, and so people know you have
10 a low interest program.

11 MR. BROWN: Yes, they do.

12 MR. WATSON: Q. What does Hydro do to
13 ensure that it will be repaid?

14 MR. BROWN: A. No. 1, we do our own
15 technical review of the project. We insist on either a
16 consultant study or equivalent of the project to prove
17 its technical viability over the long term. We have
18 our normal contractual requirements that ensure the
19 long-term viability of the project, and we also do a
20 financial review of the proponent.

21 Q. Okay, you mentioned a financial
22 review, Mr. Brown. I would like to clear up one point
23 before I move on. You have indicated that in certain
24 of your negotiations you may or may not get all of the
25 NUGs financial information?

1 A. That's correct.

2 Q. Would it be fair to say that in a
3 situation where a NUG is asking for a loan that that
4 would not apply, you would get all of their financial
5 information?

6 A. We have to get that information or we
7 wouldn't offer a loan to them.

8 Q. Now, when you do a financial review,
9 I assume you are looking at security that a proponent
10 can put up; is that fair?

11 A. That's one aspect, yes.

12 Q. What sort of security are you looking
13 at?

14 A. It could be a letter of credit, it
15 could be part of the project assets.

16 Q. A bond?

17 A. Anything that has some value to us.
18 It depends on what the loan is being put towards as
19 well. If it's going towards a project, it's mostly the
20 assets we are looking for.

21 Q. Well, the reason I was asking that,
22 Mr. Brown, is if a proponent can put forward good
23 security such as a letter of credit or a bond, it seems
24 as though the developer has a certain creditworthiness
25 to post such security, if that's the situation why does

1 Hydro need to be involved in loaning money? Why can't
2 he get the loan elsewhere?

3 A. He can.

4 Q. I beg your pardon?

5 A. He can.

6 Q. He can.

7 A. Yes.

8 When we initiated this program many years
9 ago, financial institutions were not active in NUG
10 development, and we started offering this program and
11 there was interest.

12 Since financial institutions have become
13 very active in their involvement in NUG projects, we
14 have seen almost no requests for our own loans.

15 Q. Correct me, if I am wrong, Mr. Brown,
16 my understanding was that Hydro had considerable
17 amounts set aside for loans for NUGs; isn't that fair?

18 A. Not in terms of project size. I
19 believe the number was about 90 million for low
20 interest loans, and when you look at a project size,
21 that's one project.

22 Q. Okay. How does that 90 million
23 compare to the other financial programs? How much do
24 you have set aside for some of the others?

25 A. The other ones don't require capital.

1 They are monthly payments or annual payments, and they
2 are not capital, so they are treated differently, and
3 the number I believe is \$38 million for those over a
4 five year period.

5 Q. So 90 million as opposed to 38
6 million, those are the numbers?

7 A. 90 for the loans and 38 for
8 performance payments or interest rate buydowns.

9 Q. The other five options.

10 A. Yes.

11 Q. I assume it is possible that in a
12 situation where Hydro gives a loan, some developers may
13 have little, if any, equity in their project.

14 A. We are looking at, if we are offering
15 the loan, to be in a position to get 75 per cent, at
16 least 75 per cent of the project assets.

17 Q. Mr. Brown, I was interested in what
18 you said about the current state of affairs. I guess
19 in the past financial institutions were not rushing to
20 loan money to NUG proponents and you are saying the
21 situation has now changed.

22 A. That's correct.

23 Q. Based on that, is it fair to say that
24 Hydro is going to reconsider their low interest loan
25 program?

1 A. I think we are included it for
2 flexibility. There may be some reason in the future
3 where a particular proponent may want a low interest
4 loan from Ontario Hydro. Current activities suggest
5 that's not the case and that proponents are getting
6 their own financing and are quite happy with just a
7 rate if it's purchase or in load displacement in one of
8 our other project options.

9 Q. Mr. Brown, my client is interested in
10 the fact that Hydro is assuming risk. I guess we will
11 all agree that one of the advantages of NUGs that you
12 put forward is that there is an ability to off-load
13 some risk.

14 Now, if there are other avenues open to
15 promote these NUGs such as buying down the commercial
16 financing rate, and they don't involve Hydro assuming
17 any risk, and you have indicated that people are not
18 coming forward and asking for it, why should there be
19 this program?

20 A. I think we want to leave flexibility
21 in our negotiation process. There may be a time when a
22 proponent wishes to have that option available to them
23 and it may be the only reason why that project goes
24 ahead.

25 Q. So the flexibility is more important

1 than the fact that you are assuming risk?

2 A. It's a very small part of our
3 business and it does involve risk by Ontario Hydro but
4 we cover that risk with our due diligence before a
5 project goes in service.

6 Q. Now, panel, let's take a situation
7 where we have Hydro purchasing NUG power from a
8 proponent for sale to another customer, as opposed to a
9 situation where Hydro is purchasing NUG power for sale
10 back to the same customer, now other than some small
11 transmission differences, is it fair to say that those
12 two situations are basically the same from Hydro's
13 perspective?

14 MR. SNELSON: A. I don't think we can
15 differentiate where the power to any particular
16 customer comes from. Once the power has entered the
17 system, then it can't be differentiated as to its
18 source.

19 Q. Based on this, I would assume that it
20 would be appropriate for load displacement generation
21 to receive the same purchase prices, purchase
22 non-utility generation; is that fair?

23 MR. VYROSTKO: A. That's correct.

24 Q. Now, if municipal utilities were
25 allowed to build their own resources and receive

1 avoided cost rates for the power under, say, a
2 simultaneous buy/sell program, the ratepayers would
3 benefit from the differential between the purchase rate
4 for the power sold to Hydro and the cost of the power
5 being produced; is that fair?

6 [11:46 a.m.]

7 A. If the rates that were being paid for
8 electricity were lower than the avoided cost being
9 charged and paid for the generation, then there would
10 be value there.

11 DR. CONNELL: Sorry, Mr. Watson. That
12 question, the benefit applies presumably to the
13 customers in the region of that municipal utility, does
14 it?

15 MR. WATSON: I think the benefit could
16 apply to those customers or it could be a more
17 broad-based benefit.

18 DR. CONNELL: You meant the broader
19 context, did you, when you framed the question?

20 MR. WATSON: I was thinking of the
21 utility customers, but I think it could be a more
22 broad-based benefit as well.

23 Q. And perhaps the panel could help us
24 with that?

25 MR. VYROSTKO: A. Typically, if we were

1 to buy a non-utility generator there are advantages to
2 the system to acquiring that generation, and typically,
3 if we can get it below avoided cost where we would not
4 only get that generation with the benefits it provides
5 but also at a lower value than we would typically have,
6 so there would then be that benefit to the group in
7 total.

8 Q. Now, Mr. Vyrostk, if I could take
9 you back to the question I was asking about the
10 municipal utilities.

11 Now, instead of a municipal utility in
12 there could I put in a NUG developer, the same question
13 with a NUG developer? In that situation the
14 differential is going to be reflected in profit to the
15 NUG developer; isn't that fair?

16 A. That's correct.

17 Q. Now, as Ontario Hydro and I guess
18 most of us are concerned about overall electricity
19 rates to customers within Ontario would you agree that
20 a NUG installed by a municipal utility is going to be
21 more economically beneficial to the customers without
22 the profit margin for the NUG?

23 A. To which customers are you referring?

24 Q. Can you think of some customers where
25 it wouldn't be beneficial?

1 A. It would be beneficial to some
2 customers, yes.

3 Q. Well, okay. I won't ask you to
4 detail all those. The customers within the utility
5 region affected?

6 A. There could be benefits to the local
7 utility.

8 Q. Now, in your witness statement, page
9 6, which is reproduced at page 64 of Exhibit 340, at
10 the top of the page, paragraph 19, you are indicating:
11 The policies on backup power, simultaneous buy/sell,
12 and competitive bidding are currently under
13 development.

14 Can you give us any details on what's
15 happening with simultaneous buy/sell?

16 A. I think at this stage what we are
17 doing, we are developing a scoping document to try to
18 identify all the issues that should be discussed as we
19 move forward with the simultaneous buy/sell, and that's
20 as far as we have gotten I believe to date.

21 Q. Do you have any idea when such a
22 policy might be issued?

23 A. If in fact we were to go with the
24 policy we would be looking at probably sometime next
25 year.

1 Q. Are you consulting with the municipal
2 utilities on that?

3 A. At this stage, because we haven't got
4 the scoping document, we haven't been yet currently.

5 Q. Do you anticipate doing that before
6 the policy is issued?

7 A. Again, it depends on the
8 circumstances, what some of the issues that are
9 identified in that policy are. Then if the impacted on
10 the utilities we would be discussing that with them.

11 Q. Well, you are not telling us that a
12 simultaneous buy/sell policy issued by Hydro would have
13 no effect on a municipal utility?

14 A. No, I didn't say that. What I was
15 trying to say is that I don't know what the
16 implications of simultaneous buy/sell would be to us,
17 and until I know what that is I am not sure who I will
18 be discussing with that policy.

19 We may elect not to go at all, depending
20 on what the findings are.

21 Q. Mr. Vyrostkco, I am sure it comes as
22 no surprise to you that the MEA is very interested in
23 the issue of simultaneous buy/sell. Can you give my
24 clients some assurance that before you implement a
25 policy on that issue that you would consult with them?

1 A. I think in my direct evidence I
2 talked about some of the groups that we're members of
3 and committees that we sit on. One is the Non-Utility
4 Generation Advisory Council, and the other one is -- we
5 have been on a task group with the Municipal Electric
6 Association on their parallel generation policy.

7 And to date we have used NUGAC especially
8 to bring any proposed projects forward. The
9 Non-Utility Generation Advisory Council, or NUGAC, has
10 the MEA as a member, and clearly we would be then
11 taking it to them.

12 Q. So before you implement that policy
13 you would take it to NUGAC.

14 A. We would be discussing the
15 implications of that policy to NUGAC.

16 Q. And the MEA would have an opportunity
17 to make input at that stage?

18 A. They would.

19 Q. Mr. Vyrostk, can you help us as to
20 what is the difference between simultaneous buy/sell
21 and paying up to avoided cost for load displacement?

22 A. Typically, load displacement is where
23 the developer or the customer would build a facility
24 and use that facility themselves for their own
25 electricity, and therefore, there may not be any net

1 sale coming to, for instance, Ontario Hydro, and
2 therefore, there is no opportunity to give a purchase
3 rate to that project.

4 So simultaneous buy/sell allows us to
5 have both a selling transaction and a buying
6 transaction so that that customer gets -- continues to
7 buy electricity from the utility and then sells back to
8 the utility for the generation.

9 With load displacement projects and with
10 this financial assistance program that you were just
11 previously discussing we now have that option and that
12 opportunity to then ensure that that load displacement
13 project, if it was not selling to Ontario Hydro, could
14 still get the full avoided cost for the project through
15 some of the programs in the financial assistance
16 program.

17 So in essence, a load displacement
18 project would get the same value as a project under
19 simultaneous buy/sell.

20 Q. Following up on that, Mr. Vyrostk,
21 if I could refer you to Interrogatory 5.14.51, and, Mr.
22 Lucas, that's one of the interrogatories I gave you.
23 It's not included in my package.

24 THE REGISTRAR: That was previously
25 entered and is 321.31.

1 THE CHAIRMAN: Thank you.

2 MR. WATSON: Q. Mr. Vyrostkco, if you
3 could look at the second last sentence starting with
4 the words "when the project avoided cost". That
5 continues:

6 When the project avoided cost is
7 greater than Hydro's lost revenue, Hydro
8 would see a net benefit and would share
9 the benefit with the customer.

10 Can you explain in some detail what you
11 mean by "sharing the benefit" and under what
12 circumstances this would occur?

13 MR. VYROSTKO: A. Well, I think what we
14 are saying there is to make that project economically
15 viable we would in many cases have to pay the avoided
16 cost. And so, therefore, we would then pay the avoided
17 cost.

18 Q. And that's what you were referring to
19 earlier, just a few minutes ago, when we were having
20 the discussion on load displacement?

21 A. That's correct.

22 Q. Panel, turning to page 65 of Exhibit
23 340 we are still on Mr. Eliesen's speech, and if I
24 could refer you to the last paragraph, the last
25 sentence of that reads:

1 And we have plans to help municipal
2 utilities play a larger role in the
3 development of independent power.

4 Can you tell me what those plans are? As
5 I am sure you can appreciate, my client is very
6 interested in what Hydro perceives as the larger role
7 for the municipal utilities.

8 Is there any document, or policy, or
9 report?

10 A. Basically, there is a letter that we
11 sent to the Government in response to the Government's
12 request to have us accelerate our efforts on
13 non-utility generation back in November of last year.

14 In that document, and I think we
15 discussed it in our direct evidence, one of the
16 initiatives there was to in fact assist with the
17 municipal utilities in creating a greater awareness of
18 non-utility generation within their developments, and
19 so we have recently communicated to the Government what
20 some of those initiatives would be.

21 Q. Can you communicate them to us?

22 A. Yes. For instance, some of them had
23 to do with policy development; for instance, looking at
24 backup policy as a fundamental issue with respect to
25 municipal utilities and their movement towards

1 non-utility generation. It was assisting them with the
2 analysis and the understanding of non-utility
3 generation and how it applies to a lot of their
4 customers, specifically load displacement projects;
5 holding annual workshops or at least periodic workshops
6 with the Municipal Electric Association to help their
7 members understand what non-utility generation is all
8 about.

9 So, it was a multi-faceted approach with
10 both policy development and communication and
11 assistance.

12 Q. Mr. Eliesen referred to plans. Are
13 the plans written down anywhere, aside from this letter
14 that you are referring to?

15 A. No, that is our -- one of the issues
16 is for us now to develop that into a specific action
17 plan with initiatives in there. This is a general
18 overview as to what we felt we would like to do with
19 the utilities in general and then we would develop
20 specific actions coming out of that.

21 Q. And do you have people working on
22 those plans right now?

23 A. Yes, I do. Well -- yes, I do.

24 Q. I suppose when Panel 5 finishes you
25 will have more people working on those plans?

1 A. That was the comment I was going to
2 make, yes.

3 Q. You mentioned the letter to the
4 Government. Can you produce a copy of that letter?

5 A. I believe I can.

6 MR. WATSON: Can we have an undertaking
7 for that, please, Mr. Chairman?

8 THE CHAIRMAN: Undertaking?

9 THE REGISTRAR: That will be 322.20.

10 ---UNDERTAKING NO. 322.20: Ontario Hydro undertakes to
11 produce letter to Government re action
plan.

12 MR. WATSON: Q. Panel, if I could refer
13 you to page 66 of Exhibit 340?

14 That refers to a question on Hydro's
15 policy on non-utility generation and its application to
16 municipal utilities, and your answer in the middle
17 paragraph reads:

18 Municipal utilities are given equal
19 footing with private enterprise with
20 respect to all NUG policies and programs.

21 And in your witness statement you
22 referred to three financial programs or three
23 assistance programs, if I could. One was the financial
24 assistance program that we have just discussed a few
25 minutes ago, and you have made that quite clear that

1 that applies to municipal utilities as well. That's
2 correct?

3 MR. VYROSTKO: A. That's correct.

4 Q. Another assistance package that was
5 mentioned was the consultant study assistance program.
6 Does that apply to municipal utilities?

7 MR. BROWN: A. The intent of the
8 consultant study assistance is for customers of Ontario
9 Hydro, and municipalities are customers of Ontario
10 Hydro. It is a focus on cogeneration projects.

11 Q. So the answer is "yes"?

12 A. If a municipality wanted to build a
13 cogeneration facility and they needed some assistance
14 in studying it, then we could help them.

15 Q. They would be equally as eligible as
16 a private developer?

17 A. They have to meet the same criteria,
18 that's right.

19 Q. Now, your interrogatory uses the
20 words "equal footing".

21 When looking at the difference between a
22 private developer and a municipal utility, I think one
23 of the significant issues to look at is finances.

24 Now, isn't it fair to say that a
25 municipal utility, in effect, has to make financial

1 disclosure to Ontario Hydro? Doesn't Hydro have in
2 effect access to a municipal utility's books?

3 MR. VYROSTKO: A. Yes, we do.

4 Q. Whereas, you have indicated in your
5 testimony that not all NUG proponents are going to
6 provide you with complete financial information; isn't
7 that fair?

8 A. That's correct.

9 Q. Now, if I could look at another area,
10 the transmission adder. Now, if a NUG is within a
11 municipal utility franchise area it is eligible for a
12 transmission adder; is that correct?

13 A. I believe so.

14 Q. In the same situation would the
15 municipal utility be eligible for the same transmission
16 adder?

17 A. Depending on the circumstances, I
18 would think that if there were applications appropriate
19 they would.

20 Q. Panel, I have provided you with
21 another exhibit.

22 THE CHAIRMAN: Perhaps you should give
23 5.9.14 a number?

24 THE REGISTRAR: That will become the
25 vacated number 321.49.

1 THE CHAIRMAN: Thank you.

2 ---EXHIBIT NO. 321.49: Interrogatory No. 5.9.14.

3 MR. WATSON: Q. Panel, I provided you
4 with an exhibit which is the first page of a Ministry
5 of Energy report. It is entitled "Cogeneration
6 Encouragement Program". I believe I have provided
7 copies to Mr. Lucas.

8 THE REGISTRAR: That would be Exhibit No.
9 341, Mr. Chairman.

10 THE CHAIRMAN: Thank you.

11 ---EXHIBIT NO. 341: Ministry of Energy report,
12 entitled "Cogeneration Encouragement
Program".

13 MR. WATSON: Q. Panel, you will see that
14 this Exhibit No. 341, which is entitled "Cogeneration
15 Encouragement Program", refers to three assistance
16 packages.

17 Now, is it fair to say that these
18 assistance packages are in addition to the Ontario
19 Hydro assistance programs that we have been discussing?
20 [12:08 p.m.]

21 MR. BROWN: A. No, that is not true.

22 Q. So if you get the government
23 assistance package, you cannot get Hydro assistance?

24 A. No we have been co-ordinating our
25 efforts with the government. It is usually one or the

1 other.

2 Q. So there are no NUG projects that
3 have both government assistance through one of these
4 programs and Ontario Hydro assistance?

5 A. The government may have co-operated
6 in a study with us in our program, but it wouldn't have
7 fallen under this program specifically.

8 Q. Would they have contributed some
9 money when they co-operated with the study?

10 A. That's correct.

11 Q. Well, I'm not sure I see the
12 difference, Mr. Brown.

13 A. Well, I guess...

14 Q. If we have a separate government
15 program that someone can go to and get money there,
16 what's the difference between that and the government
17 providing you the money to do the same study?

18 A. Well, I guess my point is that they
19 are not additive. You can't go to the government and
20 get all their money and then come to Ontario Hydro and
21 get all their money and put it in your pocket and you
22 can do a study. When this happens, we talk to the
23 government and the proponent, we co-ordinate our
24 efforts so it is one proposal, not 2 different
25 proposals.

1 Q. I notice in looking at this that the
2 provincial programs have caps. Do the Hydro programs
3 have caps?

4 A. That's correct.

5 Q. Are they similar?

6 A. No. Our cap is 50 percent or 50
7 thousand. The understanding is that the government
8 program is addressing smaller cogeneration
9 opportunities. Ontario Hydro is looking at the larger
10 cogeneration opportunities.

11 Q. Panel. If you could turn to page 67
12 of Exhibit 340. That's Interrogatory 5.9.40.

13 THE CHAIRMAN: Could we have the number
14 for it?

15 THE REGISTRAR: Oh, I beg your pardon.
16 5.9.40 is 321.52.

17 ---EXHIBIT NO. 321.52: Interrogatory No. 5.9.40.

18 MR. WATSON: Q. That Interrogatory
19 discusses replacement and supplementary power, and it
20 assumes at the bottom of the answer, the third
21 paragraph, that 25 percent of NUG capacity is low
22 displacement power. Is that number still valid today?

23 A. I haven't looked at that for the 1991
24 NUG plan yet.

25 Q. Well, the only difference could be

1 what would be occurring with the extra 1,000 megawatts,
2 is that correct?

3 A. A simple analysis is that the 1,000
4 megawatts is all purchase and would decrease this
5 number.

6 Q. So if it decreased the number, in
7 effect, the megawatts would still be the same if the
8 percentage differed roughly?

9 A. I expect the megawatts to be fairly
10 similar.

11 Q. And you indicate that it is not known
12 how much of the load displacement power would use
13 replacement power or supplementary power. Is that
14 still accurate?

15 A. That's a choice made by the
16 proponent. Both are available.

17 Q. I understand that, but your answer
18 was that you don't know at this time what's going to
19 happen. I guess where I'm leading with that is that
20 I'm curious as to whether any amount for the
21 replacement power has been included in your reserve
22 margin calculations or your demand/supply balance
23 calculation.

24 MR. SNELSON: A. Perhaps I can speak to
25 that? We make allowances for reserve requirements on

1 non-utility generation. We don't do it explicitly by
2 counting up whose contract is for replacement power and
3 who is contracted for supplementary power.

4 Q. Is there a document somewhere that
5 tells us how you account for NUGS in your reserve
6 margin? I don't want to get into an in-depth
7 discussion now. I know we spent a lot of time with
8 Panel 2.

9 A. I think it was discussed in Panel 2
10 but we do it by means of assuming a certain degree of
11 forced outage rate for non-utility generation.

12 Q. Back in your Supplementary Witness
13 Statement on page 64 of Exhibit 340 -- you don't have
14 to turn to it -- the same sentence, "Policies on backup
15 power simultaneous buy/sell and competitive bidding
16 are currently under development. The same question
17 with respect to backup power. Where are you with
18 respect to your policy?

19 MR. VYROSTKO: A. I think we're about
20 the same place as with simultaneous buy/sell. We are
21 developing a scoping document to identify all of the
22 issues that have to be addressed, and then from there
23 we're going to develop an action plan as to how do we
24 get at all of those issues.

25 Q. Is the same time frame reasonable?

1 Next year maybe?

2 A. I'd say maybe.

3 Q. So you're not as firm with this
4 policy as you are with the simultaneous buy/sell that
5 we were discussing?

6 A. I don't know really what to extent
7 the policy and the policy development will take us.
8 And, again, if it requires a number of detailed
9 studies, those studies may, in fact, take a long time
10 to, in fact, to get some conclusions from, and so until
11 I know all of those elements I really can't say how
12 long it would take.

13 Q. Hydro has assumed a 90 percent
14 dependability factor for cogeneration, is that correct?

15 MR. BROWN: A. That's correct.

16 Q. If I could refer you to Interrogatory
17 5.14.141, which is at page 68 and 69 of Exhibit 340.
18 If I could have a number for that, please?

19 A. I believe this one has already been
20 numbered.

21 THE REGISTRAR: That is number 15. Yes.

22 MR. WATSON: Thank you.

23 Q. Now isn't it fair to say that the
24 actual dependability of existing cogeneration units is
25 well lower, well below Hydro's assumption of 90

1 percent?

2 MR. BROWN: A. The cogeneration
3 facilities that are selling electricity to Hydro, which
4 are all new, are not demonstrating 90 percent yet.

5 Q. Well, historically you have not had
6 facilities at 90 percent, have you?

7 A. Well, we have 85, 87, 79, so it's
8 been close but, again, these are very few facilities
9 and January '89 is when we started this.

10 Q. We touched on this briefly a few
11 minutes ago and I would like to come back to it.

12 We were talking about the potential that
13 economic times could cause the shut down of a plant.

14 Now if, in fact, a cogeneration unit that
15 we've been looking at here went out of business, Mr.
16 Vydrostko, you indicated that Hydro has contract
17 provisions which would allow them to take over the site
18 if you needed the power for the project, is that fair?

19 MR. VYROSTKO: A. Typically that
20 wouldn't be for the cogeneration plant. It would be
21 more for purchase projects.

22 Q. So what would happen in a
23 cogeneration plant? You don't have the contractual
24 ability to do that?

25 A. Typically. If it was a cogen plant

1 associated with, again, steam, which it clearly is, if
2 it were to go down, both the load would go down and a
3 generation would go down, so to some extent you end up
4 losing both sides of the equation.

5 Q. And you also lose the at will part of
6 the equation too, don't you?

7 A. If there was at will then, yes, you
8 would lose the at will, that's correct.

9 Q. Well, you certainly have referred to
10 at will throughout your Demand/Supply Plan and your NUG
11 plan?

12 MR. BROWN: A. It is a very small
13 component of energy.

14 Q. So I assume what you're saying is
15 that Hydro wouldn't go in and operate the facility? It
16 would just assume that the load was lost and the steam
17 was lost as well?

18 MR. VYROSTKO: A. I think on the
19 cogeneration facility where there has been an
20 industrial plant there, it would be very difficult for
21 us to, on our own, walk in and operate that plant.

22 [12:20 p.m.]

23 Q. If you to turn to page 71 of Exhibit
24 340, please, panel. This is again an excerpt from the
25 independent consultant who reviewed the 1989 NUG plan,

1 and that's included in 5.9.54, which already has a
2 number.

3 THE REGISTRAR: 321.7.

4 MR. WATSON: Q. I have two pages there,
5 in particular if you could refer to the second page,
6 which is page 72, at the top of the page, the
7 consultant is talking about a term called the post
8 power purchase contract failure rate, and the
9 consultant indicates that most utilities have used
10 ratios between 40 and 70 per cent, while using 100 per
11 cent when the projects were under construction.

12 Now, in Hydro's plan it is assuming a
13 zero per cent post power purchase contract failure
14 rate, isn't that true.

15 MR. BROWN: A. That's correct.

16 Q. And in addition to the post power
17 purchase contract failure rate, I assume it's also fair
18 to look at the pre-purchase power contract failure
19 rate, and I would suggest that would be a factor as
20 well. In fact Hydro --

21 THE CHAIRMAN: I don't follow that. What
22 do you mean?

23 MR. WATSON: In effect projects that are
24 put forward that don't come through.

25 THE CHAIRMAN: They can't have a failure

1 rate until they go into operation, can they.

2 MR. WATSON: Perhaps I will change the
3 terminology.

4 Q. You have a situation where not only
5 can you have projects that don't go forward after the
6 contract is signed, you can have a situation where
7 projects that are put to you prior to commitment will
8 be withdrawn for any number of reasons.

9 MR. BROWN: A. That's correct.

10 Q. And so looking at the pre-contract
11 stage, we would find the 1,000 megawatts of extra NUG
12 in that stage; correct?

13 A. I am not sure of the number. There
14 is about 3,000 megawatts of proposals on the table and
15 we have always said that you are not going to get all
16 of it.

17 In the NUG plan we try and to do an
18 assessment of some of those projects that have a high
19 degree of probability of going forward and to put that
20 in the forecast.

21 Q. I understand that, Mr. Brown. What I
22 was referring to specifically was the 1,000 megawatts
23 of extra NUG that we have been talking about. That's
24 all in the pre-contract stage, isn't it?

25 A. That's correct.

1 Q. And therefore, Hydro is assuming that
2 there is not going to be any pre-contract or post
3 contract problems with this 1,000 megawatts; isn't that
4 fair?

5 A. In our preliminary forecast we
6 assumed all of those would succeed, yes.

7 Q. Panel, you have discussed the
8 advantages of NUGs and one of them is the diversity of
9 supply; is that correct?

10 MR. VYROSTKO: A. That's correct.

11 Q. And I suppose part of the idea there
12 is that many small plants would lead to higher
13 reliability; is that fair?

14 A. In general terms, if they were all
15 reliable plants, then that's correct, they would
16 provide higher reliability.

17 Q. Although that really doesn't apply to
18 things like major supply NUGs, especially as the
19 Chairman said if you have no upper limit on them, does
20 it?

21 A. The major supply NUGs would not be as
22 dispersed as the smaller NUGs would be, so part of that
23 advantage would not necessarily be there.

24 Q. Now, I think we have established that
25 the majority of NUGs are fueled by gas; is that

1 correct?

2 A. That's correct.

3 Q. And of course when I was looking at
4 this I harkened back to a discussion I think that Mr.
5 Snelson and I had in Panel 2 when you were talking
6 about common mode failures, if you will, and if a great
7 majority of NUGs are fueled by natural gas, aren't we
8 into a situation where these NUGs are susceptible to
9 something analogous to a common mode failure?
10 Something that's applicable to gas a whole could affect
11 all of these supply options; isn't that fair?

12 MR. SNELSON: A. Depending on the
13 circumstance then that's potentially possible, yes.

14 Q. I guess it goes without saying if
15 that occurred, it would destroy or severely affect the
16 economic benefit of NUGs to the system.

17 A. I think all options have some
18 potential for common mode failures and that's a risk
19 that must be accepted with all options. One tries to
20 keep the risks to a minimum.

21 Q. During Mr. Rodger's cross-examination
22 there was some discussion with him regarding the use of
23 condensers by cogenerators, and the point was that
24 condensers could be used so that cogenerators could
25 operate when the steam is not required by the

1 industrial process. Do you recall that, panel?

2 MR. BROWN: A. That's correct.

3 Q. Now, isn't it fair to say that not
4 all cogenerators have such condensers?

5 A. The high efficiency ones don't
6 normally have condensers.

7 Q. And the ones that do have condensers
8 may not have condensers that are rated highly enough to
9 deal with the high pressures and volumes of steam that
10 would be forth coming in such a situation; is that
11 fair?

12 A. I am not sure of that. It depends on
13 the actual design. There may be the odd one that is
14 not fully designed to take all process steam through
15 the condenser if the process is off. There are some
16 designed to take the full output of the generators
17 without process as well.

18 Q. And the ones that do not have the
19 appropriate design criteria, they are not going to be
20 able to operate at full capacity; isn't that fair?

21 A. There would be some derating if the
22 process is decreased.

23 Q. Do you have any idea what percentage
24 of the sites have condensers and of those that do have
25 condensers, how many are appropriately sized

1 condensers?

2 A. The ones that are in service, there
3 is no condensers. The new project proposals we have, I
4 don't know if they are that far along in the design
5 that they would know exactly what size the condenser is
6 going to be, so I can't provide a number at this time.

7 Q. Well, is it an Ontario Hydro policy
8 that, shall we say, the new cogeneration facilities
9 have these condensers so that they would be available?

10 A. No, it's not.

11 Q. If we are talking about the normal
12 cogeneration facility, not the over-sized cogeneration,
13 is it fair to say that if the project is not using the
14 steam for its industrial process, it is generally not
15 economic to produce power based on the time
16 differentiated rates?

17 A. In the majority of cases that's true.
18 There are probably other cases where the use of waste
19 fuels would be economic.

20 Q. As we have discussed this morning,
21 that would be in a very small percentage of the
22 applications.

23 A. In terms of 3,100 it's small, yes.

24 Q. I had a question on how NUGs are
25 dealt with in the F&D model that we discussed in Panel

1 2, the frequency and duration model. Mr. Snelson, I
2 guess this question would be directed to you.

3 How are NUG DAFORS treated in the F&D
4 model? Do they assume a 5 per cent or a 15 per cent
5 forced outage rate?

6 MR. SNELSON: A. I think we have given
7 an undertaking on that in Panel 2. Actually, the
8 undertaking I was referring to was for your own, one of
9 your own undertakings, 142.27. I notice that that
10 refers to the planned outage factors and the
11 maintenance outage factors.

12 Q. What about the forced outage rates?

13 A. I have a page of transcript here,
14 which is page 3221, I am afraid I don't have the volume
15 that it comes from, and it was Mr. Taborek's testimony
16 that the forced outage rates assigned to NUG units are
17 10 per cent. Now, that is at the time at which the F&D
18 studies were being done that determined the 24 per cent
19 reserve margin.

20 In current modelling we would be using
21 the DAFORS from the latest corporate forecast of outage
22 indices which is also an exhibit in this proceeding,
23 and they, I believe, identify a 15 per cent forced
24 outage partly due to steam derating and partly due to
25 equipment problems and that's what would be modelled.

1 Q. So, it's a 15 per cent number that's
2 used in the F&D model now?

3 A. That would be used in current
4 studies. 10 per cent was used at the time of setting
5 the 24 per cent reserve margin.

6 MR. WATSON: Mr. Chairman, you indicated
7 yesterday that you wanted to finish at four o'clock.
8 If that's still your intention, perhaps now would be a
9 good time to take lunch.

10 THE CHAIRMAN: All right.

11 MR. WATSON: I can tell you that I am
12 moving quite quickly. I would say I might be another
13 hour.

14 THE CHAIRMAN: So if we stop now and came
15 back at two o'clock, that would be all right?

16 MR. WATSON: I think that would be fine.

17 THE CHAIRMAN: All right, we will do
18 that.

19 THE REGISTRAR: The hearing is adjourned
20 until two o'clock.

21 ---Luncheon recess at 12:32 p.m.

22 ---On resuming at 2:03 p.m.

23 THE REGISTRAR: This hearing is again in
24 session. Be seated, please.

25 MR. B. CAMPBELL: Just before continuing,

1 Mr. Chairman, I believe there was a matter that Mr.
2 Brown had undertaken to speak to just after the lunch
3 break and he is prepared to deal with that.

4 THE CHAIRMAN: Okay.

5 MR. BROWN: This morning we were
6 discussing the pulp and paper contribution in the
7 achievable potential. If I could turn you to
8 Interrogatory 5.9.48, there is a breakdown by
9 megawatts. I think the request this morning was a
10 breakdown by the number of projects, and the answer to
11 the question is, 9 out of 19 projects are in the pulp
12 and paper industry.

13 MR. B. CAMPBELL: 321.37.

14 THE CHAIRMAN: Was that not previously
15 recorded?

16 MR. B. CAMPBELL: Yes. 37.

17 THE CHAIRMAN: 37, all right. Thank you.

18 MR. WATSON: Thank you, Mr. Brown.

19 Q. Now, this morning, panel, we were
20 discussing the fact that NUGs are expected to receive a
21 transmission credit in the forecasts that you have been
22 preparing. Is it fair to say that there have been
23 examples of NUGs in the past that have posed
24 transmission problems on the existing system?

25 MR. VYROSTKO: A. I think there have

1 been situations where projects have created some
2 problems on the transmission system.

3 Q. Shouldn't the probability of this
4 problem or this possible problem be reflected in the
5 derating of the transmission credit?

6 A. Typically, if there is a cost
7 associated with connecting the non-utility generator in
8 terms of overall system implications, that would be
9 charged to the developer.

10 Q. Are those costs charged if the
11 problem occurs after-the-fact as well as if they
12 occur -- or if they are anticipated before the fact?

13 A. I think it would be very difficult to
14 try to identify an after-the-fact situation and go back
15 to contract and try to do something about it.

16 The whole point of our work to try to
17 integrate NUGs is to identify at the front end all of
18 the implications and then incorporate that into the
19 contract.

20 Q. I understand that, Mr. Vyrostko. My
21 concern was that I have been advised that there have
22 been -- there is at least one situation where a NUG
23 caused a transmission problem after it was hooked up to
24 the line, and that would be after the contract process
25 was over. My information is the EB Eddy plant near

1 Ottawa.

2 MR. BROWN: A. I don't believe EB Eddy
3 has posed a problem in our system at the Ottawa plant.
4 They are looking at a proposal on that site. It's one
5 of the historical NUGs that's been around for a long
6 time. They are not selling anything to Ontario Hydro.

7 Q. So your evidence is to the best of
8 your knowledge, there has not been a problem with
9 historical NUGs on the transmission system?

10 A. There may be an occasion such as a
11 forced outage on our transmission system that may
12 require some action on behalf of a NUG over an hour or
13 two on a short-term basis for emergency conditions, and
14 to date, NUGs have responded to that need.

15 Q. Panel, if you could look at pages 73,
16 74 and 75 of Exhibit 340, and that is Interrogatory
17 5.14.111.

18 THE REGISTRAR: That was previously
19 entered under 321.3.

20 MR. WATSON: Q. And you will notice on
21 page 75 there is a map that we have seen before showing
22 the areas of relative preference. I think we discussed
23 this morning that this sort of analysis was not taken
24 into account in the NUG forecast; is that fair?

25 MR. BROWN: A. In the 1990 NUG plan we

1 only looked at the east/west flow going to the
2 northwest region and these are outside of that area.

3 Q. And for the '91 forecast?

4 A. The '91 plan we are going to develop
5 the plan with no transmission restrictions, to identify
6 where we think NUGs will go without the transmission
7 restrictions.

8 Q. So that means that NUGs which occur
9 in the undesirable areas would also be given a
10 transmission credit in the same way that those in the
11 desirable areas would get the credit?

12 A. In terms of the forecast they are all
13 being treated equally but not in negotiation.

14 [2:08]

15 Q. Now in looking at the calculation of
16 the transmission credit, perhaps Mr. Snelson this
17 question is for you.

18 Is that, is that calculation shown in
19 Exhibit 84, the avoided cost determination back in
20 1989. If not, could you tell me where it is?

21 MR. SNELSON: A. I believe it's going
22 to be dealt with in Panel 7, and in detail, and that
23 the interrogatory which attaches the material is
24 actually Interrogatory 7.7.16, and Dr. Macedo will be
25 able to talk to it in greater detail than I can.

1 THE REGISTRAR: That will be 321.53.

2 THE CHAIRMAN: Thank you.

3 ---EXHIBIT NO. 321.53: Interrogatory No. 7.7.16.

4 MR. WATSON: Q. Is it fair to say that
5 the transmission credit is in, effect, a levelized type
6 of calculation?

7 MR. SNELSON: A. Yes.

8 Q. And when we're dealing with that sort
9 of calculation, aren't we talking about, in effect, a
10 linear one for one relation, if you will, between a NUG
11 load given the credit and the transmission need
12 displaced?

13 A. It's an average levelized value,
14 so it's an average across the province, and it is
15 levelized in terms of time.

16 Q. Is that not a linear relationship?

17 A. It's assumed to be linear.

18 Q. And we know that all of the NUGS in
19 the forecast are assumed to be dispatchable. Wouldn't
20 you expect that as the level of non-dispatchable NUGS
21 increases in an area that there is not going to be a
22 linear one for one reduction in transmission need?

23 A. I haven't thought of it in those
24 terms. The way I tend to think of it is that
25 non-dispatchable NUGS in an area are, do not cause

1 transmission problems provided the minimum load in the
2 area is higher than the amount of non-dispatchable
3 generation in that area or significantly higher and/or
4 that the transmission capability out of the area is
5 large compared to the amount of non-dispatchable
6 generation in the area. It is the two things. It is
7 the amount of the load there is to absorb the
8 generation even in the minimum load times and the
9 capability to get the excess generation out of the
10 area. So if the amounts are relatively small in that
11 sense, then the non-dispatchability should not increase
12 transmission requirements.

13 Q. And, of course, the converse is true.
14 You're saying if they're small there isn't a problem?
15 If they aren't small, there is a problem?

16 A. It is possible at that they may cause
17 transmission concerns, and that's one of the things
18 that we have identified as being something we have to
19 pay more attention to, particularly for non-utility
20 generators that have the freedom to site in places that
21 are suitable from the power system point of view.

22 Q. When you say you're going to pay more
23 attention to it, does that mean that you're going to
24 consider whether there should be a derating of the
25 transmission credit in certain instances?

1 A. The area we expected to have a
2 significant influence in is when it comes to a need for
3 and a selection of major supply NUGS because they are
4 non-utility generators who are primarily producing
5 electricity and should site according to the needs of
6 the transmission system and electricity system. The
7 cogeneration and waste fuel generation and hydraulic
8 generation, then there may be some adjustment to
9 avoided cost methodology to account for it, but we
10 haven't determined what that is yet.

11 Q. The other area you did mention was
12 oversized cogen. Can we assume that that would be
13 treated for your analysis in the same way as major
14 supply NUG?

15 A. I think Mr. Vyrostk may be having
16 something to say about that to the cogen people
17 tomorrow and will be advising this Board of what was
18 said there when we resume.

19 MR. CHAIRMAN: I guess I should
20 interject. For my own information, Mr. Campbell, what
21 exactly is your understanding of what is happening
22 tomorrow? It has been referred to obliquely several
23 times.

24 MR. B. CAMPBELL: It's simply that the
25 project proponents, as I understand it - perhaps Mr.

1 Vyrostko could correct me if I am wrong - the project
2 proponents who have projects under consideration at
3 this time, a meeting of those project proponents is
4 being convened in order to advise them of the criteria
5 that the Corporation has determined as to where this
6 efficiency cut-off would be put in place, and criteria,
7 as I understand it, that are related to that matter.

8 The panel will recall that we've talked
9 at what point does a, for instance, a cogeneration NUG
10 that has certain characteristics become, in effect, a
11 major supply NUG and thereby lose the preference and so
12 on, matters of that type or become subject to different
13 considerations if, in fact, they're going to be
14 considered at all. It's those criteria that are being
15 communicated to the industry, at least those members of
16 the industry who have projects under active
17 consideration, and that meeting is being held tomorrow,
18 as I understand it, Mr. Vyrostko.

19 Have I approximately described it
20 correctly?

21 MR. VYROSTKO: Yes, you have.

22 MR. CHAIRMAN: And then will there be a
23 product out of that meeting that will be filed here
24 or...

25 MR. B. CAMPBELL: Yes, we anticipate

1 that and I hope to provide it to my friend after the
2 meeting tomorrow, and we hope to file it here next
3 week.

4 I gather that these guidelines are now in
5 a form that -- some small number of pages, and will be
6 distributed here next week.

7 Our concern is as, as I say, has simply
8 been that we felt that the corporation felt that it
9 would be most appropriate to communicate this
10 information directly to the project proponents and
11 avoid, if it was possible to do so conveniently, the
12 possibility of them learning bits and pieces of it by
13 reports from this process.

14 MR. CHAIRMAN: Okay. Thank you.
15 Sorry, Mr. Watson.

16 MR. WATSON: Thank you, Mr. Chairman.

17 Q. Mr. Snelson, one more system
18 question.

19 I believe you have indicated that if a
20 lot of NUG power was offered to you, that system
21 integration would be a major, major factor. I assume
22 it goes without saying that as the number of NUGS
23 increases, the system integration becomes more
24 difficulty?

25 MR. SNELSON: A. I wasn't going to use

1 the word "difficult", but it becomes more significant
2 and more necessary that the integration factors be
3 taken into account.

4 [2:18 p.m.]

5 Q. Panel, previously - and I believe it
6 was during Mr. Shepherd's cross-examination - you were
7 asked some questions - and I believe it was you, Mr.
8 Brown, who responded - about the solar/thermal project
9 in California. I believe it's calls the Luz project?

10 MR. BROWN: A. I did get questions on
11 that, that's right.

12 Q. Now, are you aware that the Luz
13 project has had recent employee layoffs and severe
14 financial difficulties?

15 A. I know they are under financial
16 problems, that's correct.

17 Q. And I have reproduced on pages 76, 77
18 and 78 of Exhibit 340 an excerpt from a weekly
19 publication which is circulated in the northwestern
20 United States dealing with electricity utilities and is
21 called the "California Energy Markets".

22 Are you familiar with this publication,
23 Mr. Brown, or any of the other members of --

24 A. We have several publications in our
25 office. I don't remember seeing this one, no.

1 Q. Okay. What this publication does in
2 this particular issue is refer to the Luz project a
3 number of times, in particular dealing with financial
4 difficulties that it appears to be having. Is there
5 anything more you can tell us about the difficulties of
6 that project?

7 A. I think, first of all, this is not a
8 technology that we see coming to Ontario because it is
9 a solar/thermal where you need direct sunlight and
10 usually located in deserts. So we haven't paid a lot
11 of attention to it.

12 In an undertaking I did for Mr. Shepherd
13 which I hope to file soon, 322.3, I mentioned to him
14 that I was aware of a few NUG projects that had been
15 retired, and I was going to undertake to identify
16 those, and in that undertaking this project did come
17 up, and the California Energy Commission told us that
18 they would not put this project on that list at this
19 time.

20 THE CHAIRMAN: In other words, it would
21 still be possibly a viable project; is that what you
22 mean by that?

23 MR. BROWN: Yes. It is definitely having
24 difficulties and there are some new players coming in
25 to try and save this project.

1 MR. WATSON: Q. Panel, if we could turn
2 to the issue of emissions for NUGs?

3 Mr. Snelson, in choosing a supply plan we
4 have heard in previous panels that there is a limit
5 placed on acid gas emissions for the province which
6 Hydro must adhere to, and I assume you have no
7 difficulty with a statement that this limitation can
8 affect the resource mix?

9 MR. SNELSON: A. Yes, it is a limitation
10 specifically on the emissions from Ontario Hydro
11 plants.

12 Q. Yes.

13 A. Imposed by the Provincial Government.

14 Q. And the emissions from NUGs which
15 produce electricity and are fossil fueled are not
16 accounted for in this particular limitation total, are
17 they?

18 A. That's correct.

19 Q. But, of course, we know that fossil
20 fuel NUGs will contribute to acid gas emissions. In
21 particular, they will contribute to NOX and CO(2)
22 emissions; is that fair?

23 A. They will, if they are fired on
24 natural gas have very low if any sulphur dioxide
25 emissions. They may have some nitrogen oxide

1 emissions -- or they will have some nitrogen oxide
2 emissions, and those two together are what is regulated
3 as acid gas emissions. Carbon dioxide emissions are
4 something separate.

5 Q. That's correct. Carbon dioxide is
6 not an acid gas, but they do contribute to carbon
7 dioxide as well?

8 A. That's correct.

9 Q. And if you turn to page 79 of Exhibit
10 340 I have reproduced page 4-2 of Exhibit 4, which is
11 the environmental analysis, and if I could refer you to
12 the right column, line 28, the sentence starts:

13 Although these emissions are only a
14 small fraction of the total emissions
15 associated with each plant, emissions on
16 a per terawatthour basis may be quite
17 similar to large, conventional generating
18 stations.

19 Is that statement still valid?

20 MR. BROWN: A. First of all, I think the
21 emissions that this statement was based on was based on
22 the 1989 NUG plan which was 1,600 megawatts, and we are
23 now looking at 3,100 megawatts, so there will be more
24 emissions in the forecast than as stated here.

25 MR. SNELSON: A. I think the point

1 though is that the emissions are similar to those from
2 a large conventional generating plant using the same
3 sort of technology.

4 Q. Yes.

5 A. So, if you were to have a
6 combined-cycle plant owned by a non-utility generator
7 or one owned by Ontario Hydro then the emissions per
8 terawatthour or per gigawatthour, whatever energy
9 measure you use, would be very similar.

10 THE CHAIRMAN: But this difference is
11 that it wouldn't be subject to the same limitations
12 that you have?

13 MR. SNELSON: The regulations as
14 currently framed are on individual entities.

15 The smelting industry has certain
16 emissions they have to abide by on a company-by-company
17 basis, and we have an emission limit that we have to
18 abide by. And the NUGs are not part of that.

19 THE CHAIRMAN: But some NUGs might be
20 part of it if they fell into the industrial category,
21 would they?

22 MR. SNELSON: The category, I believe, is
23 company by company, so...

24 For instance, Inco is a major smelter and
25 has an acid gas emission limit. If they were to be

1 generating electricity I presume that as a cogenerator
2 then their emissions might be counted within their
3 emission limit.

4 MR. WATSON: Q. Just following up on the
5 Chairman's questions, Mr. Snelson, when we are talking
6 about the acid gas limitations you are talking about
7 four companies, if you will, Ontario Hydro being one of
8 those companies?

9 MR. SNELSON: A. I am not sure that I
10 can confirm whether it is four or not.

11 Q. Well, it is on a company basis?

12 A. As I understand it.

13 Q. Yes. Most of the cogeneration units
14 that are out there are not going to be in the category
15 of one of these four, or whatever number of companies
16 we have?

17 A. Probably not. They are subject to
18 separate regulation by provincial government as they
19 see appropriate.

20 THE CHAIRMAN: I'm sorry, I didn't hear
21 the end of that.

22 MR. SNELSON: I say, they are subject to
23 environmental regulation by the provincial government
24 as to whatever regulations they deem appropriate.

25 THE CHAIRMAN: Yes, and those

1 regulations, as I understand your evidence, aren't in
2 place except for a few named companies. Is that right?

3 MR. SNELSON: We are getting into an area
4 that is a little difficult, but there are specific
5 regulations that put limits on the amount of acid gas
6 emissions that Ontario Hydro and certain other major
7 industrial concerns can emit.

8 There are also more general air quality
9 regulations, such as, under Regulations 308 is a number
10 that springs to mind, which I believe everybody has to
11 meet.

12 THE CHAIRMAN: I see.

13 MR. WATSON: Q. And, of course, the four
14 or whatever number of industries you are talking about
15 have to meet the regulations - you said Regulation
16 308 - but the acid gas is on top of that?

17 MR. SNELSON: A. Yes.

18 Q. And the acid gas limitation is a
19 limitation of 215 gigagrams of acid gas emissions per
20 year for Ontario Hydro?

21 A. After 19--

22 Q. After 1994.

23 A. --94, yes.

24 Q. And of that 215 gigagrams SOX,
25 sulphur dioxide or the SOxs, cannot be more than 175

1 gigagrams; is that correct?

2 A. I believe so. I would have to check
3 the number to be sure.

4 Q. So if we are at the top of our SOX
5 limit basically we have only 40 gigagrams remaining for
6 NOX; is that fair?

7 A. That's the apparent implication.

8 Q. If it was decided to include the NUG
9 NOX totals in the total provincial electricity
10 producing totals, that would have an impact on Hydro's
11 ability to use fossil fuels; isn't that correct?

12 A. That is possible. There could be
13 some practical difficulties in doing that in terms of
14 facilities that produce electricity and steam and
15 allocation of emissions to one or the other product.

16 Q. There certainly wouldn't be any
17 difficulty with the major supply NUGs or with the
18 oversized part of cogeneration?

19 A. The cogeneration is a matter of
20 degree, but with the major supply NUGs you are correct.

21 Q. I assume what we are talking about is
22 air quality, so I suppose it doesn't matter from a
23 point of view of the person in the street whether the
24 NOx comes from Hydro or whether it comes from a NUG;
25 it's still a concern. Isn't that fair?

1 A. I am not sure that I am able to
2 comment on the way in which the regulations are set.

3 Q. If it was decided that the NUG
4 emissions should be combined with the Hydro emissions
5 to get a provincial total and it turned out that that
6 would result in Hydro exceeding its NOx limitation,
7 Hydro would be put in a situation where it would have
8 to change its supply mix; isn't that fair?

9 A. We are talking about a hypothetical
10 situation. It is not clear to me whether in fact if
11 non-utility generation was to -- some umbrella
12 regulation was to be put into effect whether in fact
13 there would be an increase in the amounts that were
14 committed.

15 We don't specifically have a regulation
16 on NOx at the moment.

17 Q. We have the 215, which is a
18 combination--

19 A. Yes.

20 Q. --of SOx and NOx, and by implication
21 if you are at your SOx total you are only going to have
22 40 gigagrams of NOx available?

23 A. Yes, if you -- strictly speaking, if
24 you have a regulation on the sum of SOx and NOx and the
25 regulation on SOx alone, then you don't have a specific

1 regulation on NOx because you can cut back on SOx
2 emissions, sulphur dioxide emissions, to permit more
3 nitrogen oxide emissions.

4 Q. That was my point. If you are
5 cutting back on your SOx limitations you may be
6 affecting your supply mix?

7 A. You may be affecting what you can do
8 on your supply side in terms of what level of sulphur
9 you can use in coal or how much acid gas emission
10 controls you need on your plants.

11 Q. Or whether certain plants can even
12 run?

13 THE CHAIRMAN: Have you calculated
14 whether, if Hydro's limitations would include
15 Hydro-purchased NUGs, whether or not you would meet the
16 limitations or exceed them?

17 MR. SNELSON: I cannot recall
18 specifically having done that calculation.

19 Until recently we have been quite
20 uncertain as to what sort of emissions NUGs would have
21 in terms of their nitrogen oxide emissions.

22 THE CHAIRMAN: But based on your
23 forecasts and the forecast mix, as you did with your
24 own supply you made some forecast as to whether or not
25 you would stay within the limitations or not, and I

1 just wondered if you had also made the calculation, if
2 you included the purchase NUGs in that, whether you
3 would meet the limitations or whether you would still
4 stay under.

5 MR. SNELSON: As I say, I do not recall
6 having seen that calculation. It may have been done,
7 but I don't recall having seen it.

8 MR. WATSON: Mr. Chairman, I was going to
9 deal with that point as well, and perhaps I could just
10 skip ahead a little bit and deal with it now.

11 Q. Panel, if you could turn to page 82
12 of Exhibit 340, that also is an excerpt from Exhibit 4,
13 the environmental analysis. It is Figure 4-1 which
14 shows the annual atmospheric emissions from NUG in the
15 period from 1989 to 2014. And that is based on the
16 1989 NUG plan, I assume; is that correct?

17 MR. BROWN: A. The numbers available at
18 that time were the 1989 numbers.

19 Q. Yes. And, unfortunately, this copy
20 is a black and white copy and your graph is a colour
21 graph, and just for the benefit of those reading the
22 transcript and those who don't have their Exhibit 4
23 before them the top line is the NOx line, is that
24 correct, and the CO(2) line is the middle line, which
25 is very faint, and it ends just below the 3 mark on the

1 year 2014, and the lower line is the SO(2) line.

2 Does that accord with your understanding,
3 Mr. Brown or Mr. Snelson?

4 MR. SNELSON: A. Yes, it does.

5 Q. So, we see that the vast majority of
6 the emissions are anticipated to be from NOx?

7 A. No, that's not correct. The
8 left-hand scale is a double scale, and the scale for
9 SO(2) and nitrogen oxides is in gigagrams and the scale
10 for carbon dioxides is in teragrams.

11 So, in fact, if you put it all on a scale
12 of gigagrams then the carbon dioxide number would be a
13 thousand times larger than indicated here, so the bulk
14 of the emissions are carbon dioxide.

15 Q. I just want to make sure I heard that
16 figure right. You said it would be a thousand times
17 larger?

18 A. Yes.

19 Q. Now, you said this was for the 1989
20 forecast. Could you tell us what would the graph look
21 like if the 1991 forecast of 3,100 megawatts was used?

22 MR. BROWN: A. The numbers now are
23 approximately -- in megawatts are about 2-1/2 times
24 higher.

25 Q. Is there a linear relationship? Can

1 we say these figures would be about 2-1/2 times higher?

2 A. Where the uncertainty lies is in the
3 estimation of the NOx numbers, and at the time this was
4 produced we used in footnote No. 2, 17 per cent, and
5 what we are looking at now is whether that is an
6 appropriate assumption or not. And we are looking
7 around now for information to give us a better handle
8 on the NOx emissions from NUG facilities, and there is
9 not a lot of information on this.

10 Q. Well, could you give us an updated
11 version of Figure 4-1 for the 1991 plan, including
12 updates to Notes 1 and 2, giving us your best estimates
13 as of today?

14 A. In the 1991 NUG plan there is going
15 to be an environmental assessment section for the first
16 time, and we are trying to establish this criteria for
17 the 1991 NUG plan.

18 Q. I appreciate that. Are you going to
19 give us this graph in the 1991 NUG plan, and if not,
20 could I get you to give me this graph and the changes
21 to the notes?

22 A. I think I could help you with the
23 notes part. What may be difficult is trying to
24 establish the numbers themselves.

25 As Mr. Snelson earlier identified, it is

1 difficult in a cogeneration facility to attribute how
2 much of the NOx is related to the electricity
3 production and how much is related to the steam
4 production, which is why we were trying to find some
5 information in this area, and we are having very little
6 difficulty.

7 I don't know if I am going to be able to
8 come up with a NOx number.

9 Q. You said "very little difficulty". I
10 assume you meant you were having a lot --

11 A. Oh, sorry. Yes, we are having very
12 little "success" in finding the number.

13 MR. SNELSON: A. I can help you a little
14 in that our current view is that the per unit NOx
15 emissions are quite a lot less than what were
16 considered to be appropriate at the time this figure
17 was put together, and this figure was put together in
18 '89, and we hadn't seen what sort of nitrogen oxide
19 controls would be put on NUG units.

20 I believe this assumes that there would
21 not be steam injection in the combustion turbines, and
22 that steam injection is, in fact, being used in quite a
23 lot of NUG projects, and they have somewhat
24 considerably lower per unit emissions.

25 So, I wouldn't like you to suggest that

1 it's going to be even in the same order as multiplying
2 this figure up by the ratio of megawatts.
3 [2:40 p.m.]

4 THE CHAIRMAN: Just so I am clear, I take
5 it that there is no figure or diagram or statement
6 equivalent to Figure 4-1 that was made for the 1989
7 plan for the 1990 plan; is that correct?

8 MR. BROWN: That's correct.

9 MR. WATSON: Q. Panel, I guess my
10 request remains the same. I understand what you are
11 saying, Mr. Brown, that you are having some difficulty
12 with the figures. In 1989 you made an estimate, I
13 assume that you are in the process of making estimates.
14 I would appreciate it if you could provide us with the
15 update to Figure 4-1, the update to the notes with your
16 best available information.

17 THE CHAIRMAN: And if that or something
18 equivalent to it is going to be in the 1991 plan, would
19 you be prepared to await that?

20 MR. WATSON: That is fine, Mr. Chairman.
21 Just when Mr. Brown answered that question, I just
22 wanted to be sure of what we were getting.

23 MR. B. CAMPBELL: That will be fine. I
24 don't know whether we have actually got an undertaking
25 on the record to provide the 1991 NUG plan when it's

1 published. I just think as a matter of course we will
2 be providing it.

3 MR. WATSON: I would like to put that
4 undertaking on the record, Mr. Chairman.

5 MR. B. CAMPBELL: I can't believe that
6 for the second time in this panel I am volunteering an
7 undertaking, but clearly there is going to be interest
8 in.

9 In dealing with this matter I am quite
10 prepared to say that we would file the 1991 NUG plan,
11 and if my friend can look at the information that Mr.
12 Brown indicates is going to be in there, and if he has
13 any further questions, if speaks to me about it we will
14 do what we can.

15 THE CHAIRMAN: I think this information
16 would be of great interest, so if it could be produced
17 in some fashion.

18 MR. B. CAMPBELL: Yes.

19 THE REGISTRAR: That will be undertaking
20 No. 322.21.

21 ---UNDERTAKING NO. 322.21: Ontario Hydro undertakes to
22 provide the 1991 NUG plan.

23 MR. B. CAMPBELL: Mr. Chairman, I am sure
24 Mr. Brown and Mr. Vyrostk will bear all this in mind
25 when they get off the stand and can actually prepare

1 this document.

2 MR. WATSON: Q. You just told us a few
3 minutes ago, Mr. Snelson, that in looking at the Figure
4 4-1 the CO(2) numbers were a thousand times larger than
5 we see them on that graph. It's certainly possible
6 that in the future limitations on CO(2) emissions will
7 be in place in this province; isn't that fair?

8 MR. SNELSON: A. I couldn't speculate on
9 that.

10 Q. Mr. Snelson, isn't it true that in
11 1987 there was a protocol signed in Montreal dealing
12 with CO(2) emissions?

13 A. In which year?

14 Q. 1987, I believe. It's called the
15 Montreal protocol dealing with the CO(2) emissions?

16 A. Not to my knowledge.

17 Q. If there was such a protocol signed,
18 do you feel that it would be of significance and could
19 it possibly indicate that in future CO(2) emissions
20 would be in place?

21 A. I am very puzzled because if there
22 was such a protocol I am pretty sure I would know about
23 in.

24 DR. CONNELL: I think the Montreal
25 protocol was chlorofluorocarbons.

1 MR. WATSON: Q. Is it fair to say that
2 CO(2) is a topic that is attracting attention? NUGs
3 contribute to CO(2), and the possible regulation of
4 CO(2) in the future could have a dramatic affect on NUG
5 potential?

6 MR. SNELSON: A. Certainly CO(2) is
7 attracting increasing attention.

8 If you refer to Exhibit 40, which is
9 Ontario Hydro's report, task force on the greenhouse
10 effect, then on page 15 of that -- sorry, not 15 --
11 page 8 of that report there is a figure which shows the
12 proportions of carbon dioxide produced by different
13 generating technologies for a kilowatthour of
14 electricity. And natural gas-fired cogeneration for a
15 well-balanced cogeneration scheme has about one-third
16 of the carbon dioxide emissions of a coal-fired plant,
17 and is, in fact, the least carbon dioxide emissions of
18 any thermal generating process.

19 So it's hard to know whether any move
20 towards carbon dioxide regulation is going to increase
21 the pressure for cogeneration or not.

22 Q. Mr. Snelson, you mentioned that steam
23 injection might be used to reduce NOx emissions. And
24 you are currently assuming that SCR equipment, that's
25 selected catalytic reduction equipment, would not be

1 necessary; is that fair?

2 A. The assumptions on NOx control
3 technologies in general is a matter that will be
4 discussed by Panel 8.

5 Q. So, the effect of this type of
6 equipment, its costs and how that would apply to NUGs,
7 would be dealt with in Panel 8?

8 A. It will certainly be dealt with in
9 Panel 8 as it applies to combustion turbine equipment
10 that might be used either as combustion turbines,
11 combined cycle or integrated gasification combined
12 cycle, and the technology is also similar to that which
13 is used in a cogeneration, combined-cycle cogeneration
14 scheme.

15 Q. Mr. Brown, is it fair to say that the
16 majority of NUGs will not be located in the most
17 preferable areas?

18 THE CHAIRMAN: The most what areas?

19 MR. WATSON: The most preferable areas.

20 You recall that Hydro produced map
21 showing the high preference areas, their least
22 preferred areas.

23 THE CHAIRMAN: Right.

24 MR. BROWN: I think if you look at the
25 most preferred area, which is Toronto, there is not a

1 lot of cogeneration opportunity or small hydro in that
2 area. A lot of the opportunity is in northeastern
3 Ontario and some in eastern Ontario. There are pockets
4 of preferred areas in those areas.

5 MR. WATSON: Q. So by and large, they
6 won't be in the most preferred areas, save for those
7 pockets that you mentioned?

8 MR. VYROSTKO: A. I think in general up
9 to this date they have been in the preferred areas.

10 Q. I am looking at page 75 of Exhibit
11 340, Mr. Vydrostko, it looks as though the most
12 preferred areas are the ones that are surrounding urban
13 centres, Toronto, Kitchener, London, Windsor, Sudbury,
14 North Bay, Ottawa. Is it your evidence that most of
15 the NUGs are in those areas?

16 A. We have stated that there is a number
17 of NUGs situated around the North Bay area, the
18 northeastern region. There is a number of them around
19 the Ottawa area that have been installed or are in the
20 process of being installed.

21 One of the new large projects recently
22 announced is the McDonnell Douglas project in Toronto,
23 in Mississauga, which is in that area.

24 So a number of them are in those areas.

25 Q. And what sort of megawatt total, are

1 you talking more than half of the NUGs?

2 MR. BROWN: A. I would say that of all
3 the NUGs we have to date, the ones in service, the ones
4 committed and the ones that have accepted rate offers,
5 all have been able to go in spots on the transmission
6 system which would imply that at least two-thirds of
7 our 3,100 is in preferred areas.

8 Q. And of course in your statement you
9 said those in-service as well and that's going to
10 include things like the huge Dow unit in Sarnia which
11 is now classified as a least preferred area.

12 A. No, I am not including that. That's
13 historical load displacement. I am just talking about
14 our NUG plan which doesn't account for that 1,200.

15 There is about 2,000 megawatts if you had
16 the rate offers and in-service, and all of those will
17 be incorporated into the system. What is left is the
18 final 1,000 by the year 2000 and some of those may not
19 be in preferred areas.

20 Q. So about two-thirds of them you are
21 saying will be in the preferred areas, and that's, as
22 the map indicates, near the larger population centres?

23 A. This is based on some of those
24 already going in-service. There could be some in the
25 Timmins area that at the time were preferred or

1 information was available.

2 I was told Timmins is also a preferred
3 area.

4 Q. Panel, if you could turn to page 80
5 of Exhibit 340. That's an excerpt from Exhibit 249
6 which is the Ontario Ministry of Energy staff
7 discussion paper entitled "Potential for Energy
8 Conservation and Carbon Dioxide Reduction in Ontario",
9 it's dated June 1991. We referred to an excerpt from
10 that this morning, I believe.

11 If you look down to the second last
12 paragraph, talking about recycled paper, and I would
13 like to continue on from a discussion we had this
14 morning, Mr. Brown. You will notice that we are
15 talking about the pulp and paper industry in this
16 segment. The first sentence indicates that use of
17 recycled fibre can lower energy intensity per tonne of
18 newsprint by as much as 70 per cent compared to ground
19 wood pulping methods.

20 Is it fair to say that the switch to
21 recycled newsprint could have the potential to reduce
22 the steam demand for those plants that switch?

23 A. I think there is based on this an
24 opportunity that there would be reduced steam
25 - production for those people that incorporate recycled

1 print, but it also opens up the opportunity for new
2 steam hosts like the Atlantic Packaging in Whitby where
3 it's a brand new plant, a brand new steam load which
4 has a new cogeneration opportunity.

5 Q. Two things. First of all, with
6 respect to the plant in Whitby, that would be less
7 steam per unit of output; isn't that fair, because of
8 lowered intensity?

9 A. Well, that's a pure recycling plant.
10 I don't know how it would compare. Based on this
11 information it would be definitely less than virgin
12 wood in producing the same amount of paper.

13 Q. That's for the new plant.

14 Now, for the old plants we were
15 discussing the problems the pulp and paper industry is
16 facing, and it looks as though they have two choices,
17 they can either convert to the low intensity methods or
18 they are faced with an unfortunate choice of maybe
19 going out of business. Either way your steam load,
20 steam capacity is reducing; isn't that fair?

21 A. That may be a short-term view. I
22 think in the long term you can only recycle paper so
23 many times before it's of no use even to recyclers.

24 You still have to provide virgin wood
25 into the market for producing pulp and paper and that's

1 the advantage Canadian manufacturers have over U.S.
2 counterparts. So, it would be very speculative to say
3 that we are going to see a large decrease in this area.

4 Q. But despite that advantage, they are
5 still suffering today.

6 A. There are a lot of industries
7 suffering today.

8 Q. In particular the pulp and paper
9 industry.

10 A. Yes, they are. Some of that is
11 environmental as well as recyclable.

12 Q. And that's not a short-term problem?

13 A. They are working on that. It's a
14 long-term solution.

15 MR. VYROSTKO: A. Could I just maybe add
16 one point to what Mr. Brown was saying?

17 I think it is also referenced on this
18 page, and which is the last bullet point, which talks
19 about one of the other opportunities that's available
20 for the pulp and paper industry and that is improving
21 efficiency through combustion heat recovery.

22 One of the things that we are trying to
23 do with pulp and paper industry, if they are not
24 prepared to go into a newer technology, is to work with
25 the cogen side.

1 In fact, one of the issues that we have
2 seen with some of the companies here in Ontario is
3 pressure from their American counterparts to in fact
4 move towards cogen, which is a very common element in
5 the United States.

6 So therefore, even though they are
7 finding difficulties with some of the existing
8 facilities, cogeneration helps them from an overall
9 energy efficiency perspective.

10 [2:55 p.m.]

11 Q. If you turn the page, Panel, to page
12 81 of Exhibit 340, that is an excerpt from Exhibit 250
13 entitled "Degrees of Change: Steps Toward an Ontario
14 Global Warming Strategy", and that was filed by the
15 Government earlier in these proceedings.

16 If you look at the second paragraph at
17 the top of that page, the one starting:

18 Cogeneration has an advantage over
19 conventional thermal generating plants
20 because of its ability to exploit waste
21 heat created in the production of
22 electricity, thereby improving overall
23 cycle efficiency.

24 Now, if we could look at the second sentence:

25 In addition, electrical transmission

1 losses, approximately 7 to 10 per cent,
2 are eliminated since the cogeneration
3 facilities are located at the point where
4 electricity is required.

5 Now, in fairness, it is not accurate to
6 state that cogeneration will always supply energy only
7 at the site of the facilities, and that is even more so
8 with the over-sized cogen plants that you are
9 considering; isn't that fair?

10 A. That's correct.

11 Q. And, Mr. Brown, this morning we were
12 having a discussion about what percentage of NUG
13 capacity was assumed to be load displacement at the
14 site of the facilities, and the 1990 figure I believe
15 was 25 per cent based on 2,100 megawatts, and you
16 indicated while the percent would decrease the amount
17 of megawatts would stay the same. Do you recall that?

18 MR. BROWN: A. That's true, but that is
19 a contractual definition, load displacement versus
20 purchase. It still could be a purchase project and be
21 located right at the load centre. It is just that it
22 is a third party development.

23 Q. In any event, it's certainly fair to
24 say that cogeneration represents much more than the 25
25 per cent or whatever the lower per cent would be of NUG

1 capacity?

2 A. Cogeneration is probably the most
3 significant portion of the NUG plan.

4 Q. And so that statement that it would
5 eliminate transmission losses isn't completely
6 accurate, is it?

7 MR. SNELSON: A. We expect that it would
8 reduce transmission losses but by a lesser amount than
9 the 7 to 10 per cent indicated.

10 Q. The next sentence also talks about
11 substantial savings and land use. I assume the same
12 considerations would apply there?

13 A. I am not sure what land use they are
14 referring to in this, whether they are referring to the
15 land use of the generating station sites or land use
16 for transmission lines.

17 Q. I think if you continue on the last
18 sentence talks about requiring massive land rights-
19 of-ways for the transmission lines.

20 So assuming that they are talking about
21 savings in land use because you don't need transmission
22 lines, and that seems to be the thrust of the
23 paragraph, two points: one they are not eliminating
24 transmission losses; and two, there will be land
25 required for transmission facilities, especially with

1 the over-sized cogen; isn't that correct?

2 A. If they reduce the need for
3 transmission, they should reduce the need for
4 transmission lines, and to the extent that that reduces
5 the need for new rights-of-way then it would reduce the
6 land use.

7 I think the discussion of transmission
8 rights-of-way and whether that is a massive land use
9 would perhaps be better held for Panel 7.

10 Q. And, Panel, we have been talking
11 about emissions, but there is another issue with
12 respect to NUGs as well as far as the environment is
13 concerned. NUGs are not currently subject to the same
14 environmental assessment process that we find ourselves
15 involved in today; isn't that correct?

16 MR. VYROSTKO: A. Non-utility generators
17 as well as Ontario Hydro are subject to the
18 Environmental Assessment Act, but the process of
19 getting approval is different between the utility and
20 the NUGs, except -- and the only place where it would
21 be similar would be when the Minister so elects to make
22 them the same.

23 Q. Well, if Hydro was going to put up a
24 350 megawatt major supply gas-fired facility they would
25 require an environmental assessment; isn't that

1 correct?

2 A. The question was if Ontario Hydro had
3 to do that?

4 Q. Yes.

5 A. I believe it would.

6 Q. And the 350 megawatt major supply NUG
7 that you have been referring to is not going to require
8 an environmental assessment hearing, will it?

9 A. I don't know that at this stage. It
10 may or may not.

11 Q. Do you have any indication that it's
12 going to require one?

13 A. To this date, I do not.

14 Q. Now, in future isn't it possible that
15 the major supply NUGs might be subject to environmental
16 assessments?

17 A. Yes, it's possible.

18 Q. And that is not reflected in your
19 forecast, is it, Mr. Brown?

20 MR. BROWN: A. No, it's not. By using
21 the current regulations.

22 Q. Panel, in the 1990 plan you assumed a
23 retirement rate of two megawatts per year and in the
24 1989 NUG plan you assumed a retirement rate of 17
25 megawatts per year; is that correct?

1 A. That's correct.

2 Q. And this retirement rate does not
3 necessarily correspond to the 30-year life assumed for
4 cogeneration; isn't that correct?

5 A. Retirement rate in 1989 NUG plan was
6 developed assuming a three per cent retirement rate
7 based on the 1,600 megawatt forecast.

8 When we did the 1990 NUG plan we went
9 back and looked at historical information and found out
10 that it wasn't that high, that over the last I think 20
11 or 30 years that it has been averaging only two
12 megawatts per year, which is the number we used in the
13 1990 NUG plan.

14 Q. So at two megawatts per year the
15 retirements by the year 2001 would be 20 megawatts. It
16 is a straight linear relationship; isn't that correct?

17 A. That's correct.

18 Q. Panel, I have prepared an exhibit,
19 which is entitled "Age of Existing Non-Utility
20 Generation Sites". And, Mr. Lucas, if I could have a
21 number for that, please?

22 THE REGISTRAR: That will be No. 342.

23 ---EXHIBIT NO. 342: Document entitled, "Age of
24 Existing Non-Utility Generation Sites".

25 MR. WATSON: Q. Panel, this was prepared

1 based on Interrogatory 5.14.230, and perhaps you can
2 accept the figures subject to checking them in the
3 interrogatory, and if there is some error you can
4 advise us.

5 THE REGISTRAR: That will be No. 321.54.

6 THE CHAIRMAN: Thank you.

7 ---EXHIBIT NO. 321.54: Interrogatory No. 5.14.230.

8 MR. WATSON: Q. Now, in looking at this
9 table we see that there are currently 59 megawatts
10 which are more than 30 years old, and that is the sum
11 of the megawatt -- the first three figures in the
12 megawatt column: 4, 39 and 16.

13 It also shows that there are 300
14 megawatts of existing NUGs which were built in the
15 '60s, and these sites are 20 to 30 years old, and by
16 the year 2000 these sites are going to be more than 30
17 years old. I take your evidence to be that you feel
18 only 20 megawatts of this will retire by the year 2000,
19 but isn't it possible that there could be a greater
20 amount than this that retires by the year 2000?

21 MR. BROWN: A. Our estimate of
22 "retirement" is that the facility is aged, it is used,
23 and there is not -- that potential is not used again.
24 So it is a full retirement.

25 There is opportunity, if a site is

1 retired, that another cogeneration plant could be built
2 in the same location or even a larger cogeneration
3 plant.

4 So in our forecast of "retirement" is
5 that there is no redevelopment of that site.

6 Q. I guess, Mr. Brown, it would be fair
7 to say that when you are looking at NUG retirement you
8 haven't had a lot of experience. There just hasn't
9 been a lot, has there?

10 A. Due to their age there is not that
11 many that retires -- retirements. It has been filed in
12 a NUG plan the year-by-year retirements that we have
13 been aware of, and that's how we got the two megawatts
14 per year, and in Interrogatory 5.32.9, which is a list
15 of all NUGs in-service and committed, there is a small
16 section in there of known retirements over the last
17 several years.

18 THE REGISTRAR: That will be number
19 321.55.

20 MR. BROWN: I believe that should be
21 filed. 5.32.9? No?

22 THE CHAIRMAN: I don't see it off hand.
23 I haven't got a complete list.

24 THE REGISTRAR: 321.55.

25 THE CHAIRMAN: Thank you.

1 ---EXHIBIT NO. 321.55: Interrogatory No. 5.32.9.

2 MR. WATSON: Q. Panel, if you could turn
3 to the last page? That's at page 84 of Exhibit 340.
4 We have prepared a list entitled "Factors Leading to
5 NUG Forecast Uncertainty".

6 Now, in the course of your evidence, both
7 direct and cross, we have gone through a number of
8 these now.

9 I don't propose to go through these
10 again. They are just there in front of you. What I
11 would ask you to do, though, is look at that list and
12 could you tell me whether there are other factors
13 affecting uncertainty that I have not mentioned on this
14 list?

15 THE CHAIRMAN: I take it this is your own
16 list and it is not sourced from anywhere; is that
17 right?

18 MR. WATSON: That is correct, Mr.
19 Chairman. This is a list that we prepared. It would
20 be sourced from the evidence, the documentation,
21 everything we have been able to put our hands-on.

22 MR. BROWN: I may want to add -- the only
23 one I can think of is the area of alternate
24 technologies and uncertain -- plus and minus.

25 [3:10 p.m.]

1 Q. Thank you. Now in looking at this
2 list, it's fair to say that Hydro can't change many of
3 these factors? Would you agree with that, Mr. Brown?

4 A. I think there are some that we can
5 and some that are outside our control.

6 Q. Is it fair to say that there would be
7 more certainty involved if Hydro were to build its own
8 supply sources in comparison to NUG sources?

9 MR. SNELSON: A. I think it's very hard
10 to make a judgment in that regard. There are
11 uncertainties in both ways of acquiring generation.

12 Q. Now, Mr. Brown, the 1989 NUG plan
13 provided what Hydro called a range forecast to reflect
14 the uncertainties. I understand the 1990 NUG plan did
15 not provide a similar range forecast, is that correct.

16 MR. BROWN: A. That's correct.

17 Q. Will the 1991 NUG plan include a
18 range forecast?

19 A. No, it will not.

20 Q. Now, while you did not provide ranges
21 for the 1990 forecast, and don't anticipate it for the
22 1991, were they produced?

23 A. No. I believe the '89 one was done
24 specifically for input into the Demand/Supply Plan, and
25 when we did the 1990 and working on the '91 plan, we

1 did not incorporate upper and lower forecast in the NUG
2 plan.

3 Q. With the levels of uncertainty that
4 we have in this area, wouldn't it be more appropriate
5 to plan around a range?

6 A. I think there is uncertainty plus and
7 minus, which is why we do a sensitivity analysis within
8 the plan. I know there are other upper and lower
9 forecasts based on a particular variable like high load
10 growth or some scenario. For NUGS there are many
11 variables that you could have upper and lower
12 scenarios, such as gas price, capital cost. Because of
13 that we just provide the one, our best guess forecast.

14 Q. As Mr. Brown, said there are a lot of
15 uncertainties with respect to NUGS. We spent a lot of
16 time in Panel 1, dealing with all of the uncertainties
17 associated with the basic load forecasts. It would
18 seem to me that there are a lot more uncertainties
19 associated with that.

20 MR. B. CAMPBELL: I don't think anyone on
21 this panel can comment on the Panel 1 evidence.

22 MR. WATSON: I wasn't trying to suggest
23 they could, Mr. Chairman. Mr. Brown made the point
24 that there were a lot of uncertainties associated with
25 the NUG forecast. Some could affect it in a high way,

1 some in the low, and I was simply trying to point out
2 that as Hydro does a basic load forecast, there are
3 many more uncertainties involved.

4 Q. I was just wondering whether, in
5 fact, there is another answer, a better answer as to
6 why they are not doing one in the NUG forecast.

7 MR. BROWN: A. If I may just go back
8 with a little bit of history? The 1989 forecast was a
9 very first NUG forecast. There were very few utilities
10 that forecast NUGs at all. As we start progressing and
11 providing more and more forecasts we will have the
12 history that the load forecast does behind them of
13 having 60 years of data in forecasting, and I believe
14 one day the NUG forecast will be in a position and have
15 more information to do upper and lower scenarios.

16 Q. Mr. Brown, if you don't have the
17 data, isn't that more of a reason to do a range? For
18 instance, dealing with Panel 1, you use an econometric
19 forecast based on a mathematical econometric model.
20 Now, isn't what you have said an argument for having a
21 range forecast reflecting the uncertainty and the lack
22 of data?

23 MR. SNELSON: A. I believe that part of
24 this question really relates to what purpose you're
25 going to use the forecast, and how it's going to be

1 used, and the overall assessment of uncertainties in
2 the plan as a whole is something we do when we put the
3 whole plan together -- that's a planning issue, and we
4 will testify on that on Panel 10.

5 We specifically as users of that
6 information in planning did -- an upper and lower
7 scenario is where well we looked at upper and lower
8 estimates with a number of inputs for the Demand/Supply
9 Plan, and that was the purpose for which those upper
10 and lower scenarios in the '89 plan were prepared.

11 When we're coming to assess the overall
12 uncertainties of the plan we have to say which are the
13 biggest uncertainties that we face? We make judgments
14 as to which ones we'll deal with in some analytical way
15 and which ones we'll deal with in some judgmental way.

16 Q. Mr. Snelson, I don't want to get too
17 far into this, and I certainly don't want to get into
18 Panel 10 issues.

19 Hydro has told us that they're going to
20 rebalance the plan. In the course of doing that
21 rebalancing, wouldn't it be useful to know what sort of
22 range of NUGs they can expect?

23 A. In the rebalancing exercise we'll
24 have to consider the various risks that we face, and
25 how we will deal with them, and which ones we'll deal

1 with analytically, and which ones we'll try and deal
2 with judgmentally.

3 Q. But you're not going to have a range?

4 A. I don't know that we'll have a range
5 at this time.

6 Q. Two points, panel, before we finish.

7 First, looking at what the situation is
8 today, we have very low gas prices; we have low
9 interest rates; we have a number of advantages extended
10 to NUGs, such as Class 34 premiums, programs both by
11 Hydro and the government, high avoided cost, project
12 appraisals, system incremental costs that we have
13 discussed and I think it's fair to say that all adds up
14 to what you have called "a window of opportunity".

15 Now, when you add to that in the future
16 that you are forecasting, and I guess other people are
17 forecasting increased gas prices, it seems to me that
18 this is now the perfect time for NUGs, and my question
19 to you is if any projects are not being pursued now,
20 what makes you think they would be pursued in the
21 future?

22 MR. VYROSTKO: A. One of the projects,
23 or one of the types of projects that may not be pursued
24 now, but could be in the future, is the ones we talked
25 about today and yesterday with respect to the steam

1 host, and the economic situation facing the steam host.

2 A number of the industries will have
3 various cycles, up and down cycles, and so even though
4 today the environment is positive for some of the
5 projects because of low gas, low interest rates, some
6 of the industry may not be ready for that because they
7 have problems with their own market sector and whether,
8 in fact, they're making money or not, like the pulp and
9 paper industry or the steel industry today.

10 Three or four years down the road they
11 may be in the reverse situation where they have
12 recovered and they now have money, capital dollars to
13 invest, and they see the need for energy efficiency and
14 cogeneration and so they would be moving in that
15 direction at that time, and so there are some types of
16 businesses that would be moving towards cogeneration
17 whether we have this window of opportunity or not.

18 [3:20 p.m.]

19 Q. And outside of cogen?

20 A. Now, we are looking at in small
21 Hydro, for instance, because now we are dealing with
22 other technologies, small hydro may improve down the
23 road. As the industry gets a class EA document which
24 then helps the proponents to move forward, and so that
25 might open up opportunities there.

1 Alternate technologies down the road
2 might become a lot more viable as a result of either
3 changing technologies or economies of scale as costs
4 come down.

5 So, there are other windows of
6 opportunity for other types of technologies.

7 Q. Finally, panel, as you know, my
8 client strongly feels that the quality of electricity
9 service is of fundamental importance. Now, if we could
10 assume for a minute that we move to a situation where
11 you are not achieving your NUG objectives sometime in
12 the future, can you assure the MEA that the quality of
13 electricity service will not be diminished in that
14 situation?

15 MR. SNELSON: A. Reliability of supply
16 to customers can go down due to a wide number of
17 reasons which we try to minimize, but they can go down
18 because loads are higher than forecast. They can go
19 down because our own generation program gets delayed or
20 otherwise upset.

21 There is a whole list of things which we
22 rely upon to provide reliable supply. We provide
23 reserve margins and so on to protect against these
24 things, but if in accumulation they lead to a greater
25 reduction in supply or greater increase in demand than

1 we have allowed for, then there can be diminution in
2 reliability of supply until we can correct the
3 situation.

4 MR. WATSON: Mr. Chairman, those are my
5 questions for today. As I indicated before and during
6 the cross-examination, there are a number of areas that
7 appear to be affected by what is going to happen
8 tomorrow, and I would ask that I be allowed to come
9 back and continue my cross-examination at a later date
10 dealing with those areas.

11 THE CHAIRMAN: That arise out of the
12 change in policy that announcement may engender.

13 MR. WATSON: That's correct. I don't
14 want to come back and deal with whole new areas. You
15 recall several times today and yesterday, for instance,
16 in dealing with project appraisal avoided cost Mr.
17 Vyrostko suggested that there might be something that I
18 would be interested in tomorrow, and also with respect
19 to major supply NUGs.

20 THE CHAIRMAN: Of course it may be that
21 when you revisit it, it will also be clear and
22 understandable that you won't need to do that.

23 MR. WATSON: That's possible as well, Mr.
24 Chairman. I would just simply like to reserve right.

25 THE CHAIRMAN: That is fine.

1 MR. WATSON: Thank you. Those are my
2 questions.

3 THE CHAIRMAN: I suspect that others who
4 have already examined will the want to do the same
5 thing.

6 Is there anything else that we need to do
7 before we adjourn?

8 We are going to adjourn then until a week
9 Monday, which is the 28th of October, at ten o'clock,
10 and we will continue with the cross-examination of this
11 panel.

12 MR. B. CAMPBELL: Mr. Chairman, if I
13 could just record that we have now copies in response
14 to an undertaking, Exhibit 322.11, which is a document
15 entitled "Wood Waste Generation and Management in
16 Ontario", April 1991, I believe that was an undertaking
17 given to IPPSO in the course of its cross-examination,
18 and it has now been filed and copies are available for
19 those who wish it.

20 THE CHAIRMAN: It is possible also, and
21 perhaps even likely, that we may want to on the 28th
22 continue the discussion with respect to the hydraulic
23 Panel 6.

24 MR. B. CAMPBELL: Yes. As I understand
25 it, I remain under an obligation to kind of report back

1 at that time and I will be prepared to do so. What I
2 will have to say heaven only knows, but presumably I
3 will by that time.

4 DR. CONNELL: Are the revised IPPSO
5 questions now available?

6 MR. WATSON: Yes, they are, Dr. Connell.

7 DR. CONNELL: I would like a handy
8 definition of simultaneous buy/sell. I recognize Mr.
9 Vyrostko said terms and conditions remain to be
10 established, but if you could just give me some rough
11 definition of the perimeter of simultaneous buy/sell, I
12 would be grateful.

13 MR. VYROSTKO: Including the definition,
14 Dr. Connell?

15 DR. CONNELL: Yes.

16 MR. VYROSTKO: Simultaneous buy/sell, in
17 essence, is when a developer puts a project, typically
18 a generating station, on a site where there is an
19 existing customer, and rather than the customer billing
20 that facility and therefore the customer using the
21 electricity from that generating station to displace
22 the existing electricity he would buy from Hydro, you
23 in fact have a generating station that sells separately
24 to Ontario Hydro while the customer continues to buy
25 electricity from Ontario Hydro.

1 So, in essence, it's two distinct
2 transactions at the same site: A generating station
3 that sells to Ontario Hydro or to the utility, and the
4 existing facility that uses electricity and therefore
5 buys electricity from a local utility or Ontario Hydro.

6 DR. CONNELL: And this can include cogen?

7 MR. VYROSTKO: Oh, yes. In most cases
8 that's what it is, because the steam host is already an
9 existing customer and therefore is already buying
10 electricity from the utility.

11 THE CHAIRMAN: Do you have any further
12 questions?

13 MR. WATSON: No, Mr. Chairman.

14 THE CHAIRMAN: We will now adjourn.

15 THE REGISTRAR: This hearing will adjourn
16 until 10:00 a.m. Monday, October the 28th.

17 ---Whereupon the hearing was adjourned at 3:30 p.m. to
18 be resumed on Monday, October 28, 1991, at 10:00
19 a.m.
